Message

Please look beyond a 20th Century view of our energy future and realize that a true future vision for energy has to consider the changes that are beginning to happen as the climate moves into crisis mode. The incredible changes we are seeing just today in terms of hotter days weeks and years plus Hurricane Beryl's advance through the Caribbean possibly winding up in Houston or New Orleans as the strongest storm to appear at this time in the season are just the most current examples of where the careless indiscriminate use of fossil fuels is leading us. Is this pure and simple denial or is there a death wish involved with our energy policy? We have the technology to overcome this or at least mitigate some of the dangers but we are looking away, trying to keep the old method of burn it baby burn it. At least we should try. It may not be an easy transition but at least there is a chance of a transition. I'd prefer a bumpy road to going in the ditch altogether!!! Please look at and expand the role of renewables in your future energy planning.
