**Re: Duke Energy Progress, LLC's REPS Cost Recovery Rider and 2017  
Compliance Report  
Docket No. E-2, Sub 1175**

Dear Ms. Jarvis:

Enclosed for filing with the North Carolina Utilities Commission ("Commission") please find the Application of Duke Energy Progress, LLC ("DEP" or the "Company") pursuant to N.C. Gen. Stat. § 62-133.8 and Commission Rule R8-67 relating to incremental costs for compliance with the renewable energy and energy efficiency portfolio standard ("REPS") for electric utilities, together with the testimony and exhibits of Megan W. Jennings and Veronica I. Williams containing the information required by Commission Rule R8-67. DEP's 2017 REPS Compliance Report, filed pursuant to N.C. Gen. Stat. § 62-133.8 and Commission Rule R8-67(c), is attached as Exhibit No. 1 to Ms. Jennings' testimony in support of the Application. I will deliver fifteen (15) paper copies of the filing to the Clerk's Office by close of business on the following day.

Certain information contained in the exhibits of Ms. Williams and Ms. Jennings is a trade secret, and confidential, proprietary, and commercially sensitive information. For that reason, it is being filed under seal pursuant to N.C. Gen. Stat. § 132-1.2 and should be protected from disclosure. Parties to the docket may contact the Company to obtain copies pursuant to an appropriate confidentiality agreement.

Please do not hesitate to contact me if you have any questions.

Sincerely,

Kendrick C. Fentress

**APPLICATION FOR APPROVAL  
OF REPS COST RECOVERY  
RIDER AND 2017 REPS  
COMPLIANCE REPORT**

Duke Energy Progress, LLC (“DEP” or the “Company”), pursuant to N.C. Gen. Stat. § 62-133.8 and Rule R8-67 of the Rules and Regulations of the North Carolina Utilities Commission (“Commission”), hereby makes this Application (1) for approval of its 2017 Renewable Energy Portfolio Standard (“REPS”) Compliance Report, and (2) to implement a monthly charge to recover the incremental costs associated with compliance with the REPS. In support of this Application, the Company respectfully shows the following:

1. The Company is a public utility operating in the states of North Carolina and South Carolina where it is engaged in the generation, transmission, distribution, and sale of electricity for compensation. Its general offices are located at 410 South Wilmington Street, Raleigh, North Carolina, and its mailing address is Post Office Box 1551, Raleigh, North Carolina 27602.

2. The attorneys for the Company, to whom all communications and pleadings should be addressed, are:

3. N.C. Gen. Stat. § 62-133.8 requires North Carolina’s electric power suppliers to supply six (6) percent of their North Carolina retail kilowatt hours (“kWh”) from “renewable resources,” as that term is defined by N.C. Gen. Stat. § 62-133.8(a)(8), for calendar year 2017. Further, N.C. Gen. Stat. § 62-133.8(d) requires that the electric power suppliers also obtain 0.14 percent of their North Carolina retail kWh from solar photovoltaic or thermal solar resources in 2017. Further, N.C. Gen. Stat. § 62-133.8(e) and (f) require that the electric power suppliers also obtain their allocated share of the state-wide requirement of 0.14 percent of the total North Carolina retail kWh sold from swine waste resources and 900,000 megawatt hours (“MWh”) of the total electric power sold to North Carolina retail customers from poultry waste resources, respectively, in 2017.<sup>1</sup>

4. N.C. Gen. Stat. § 62-133.8(h) provides that the electric public utilities shall be allowed to recover the incremental costs<sup>2</sup> associated with complying with N.C.

---

<sup>1</sup> Both the Poultry Waste and Swine Waste Set-Aside requirements established by N.C. Gen. Stat. § 62-133.8 have been modified by Commission order pursuant to N.C. Gen. Stat. § 62-133.8(i)(2), as discussed herein.

<sup>2</sup> “Incremental costs” are defined as (1) all reasonable and prudent costs incurred by an electric utility to meet the solar and renewable generation requirements of the statute that are in excess of the utility’s avoided costs, and (2) costs associated with research that encourages the development of renewable energy, energy efficiency, or improved air quality, provided those research costs do not exceed one million dollars (\$1,000,000) per year.

Gen. Stat. § 62-133.8 through an annual rider not to exceed the following per-account charges:

<u>Customer Class</u>	<u>2008-2011</u>	<u>2012-2014</u>	<u>2015 and thereafter</u>
Residential per account	\$ 10.00	\$ 12.00	\$ 27.00
Commercial per account	\$ 50.00	\$ 150.00	\$ 150.00
Industrial per account	\$ 500.00	\$ 1,000.00	\$1,000.00

The statute provides that the Commission shall ensure that the incremental costs to be recovered from individual customers on a per-account basis are in the same proportion as the per-account annual charges for each customer class set out in the chart above.

5. Rule R8-67(c) requires the Commission to conduct an annual proceeding for each electric public utility to review the utility's costs to comply with N. C. Gen. Stat. § 62-133.8 and establish the electric public utility's annual rider to recover such costs in a timely manner. The Commission shall also establish an experience modification factor ("EMF") to collect the difference between the electric public utility's actual reasonable and prudent REPS costs incurred during the test period and the actual revenues incurred during the test period. Rule R8-67(c) further provides that the Commission shall consider each electric public utility's REPS compliance report at the hearing provided for in Rule R8-67(e) and shall determine whether the electric public utility has complied with N.C. Gen. Stat. § 62-133.8(b), (d), (e) and (f).

6. According to Rules R8-67(c) and (e), the electric public utility is to file its application for recovery of its REPS costs, as well as its REPS compliance report, at the same time it files the information required by Rule R8-55, and the Commission is to conduct an annual rider hearing as soon as practicable after the hearing required by Rule R8-55.

7. Pursuant to the provisions of N.C. Gen. Stat. § 62-133.8 and Commission Rule R8-67(e), DEP requests the Commission to establish a rider to recover its reasonable and prudent forecasted REPS compliance costs to be incurred during the rate period. As provided in Rule R8-67(e), the Company requests to collect from DEP's retail customers, through the EMF, \$410,708 of REPS costs incurred and other credits for the period April 1, 2017 through March 31, 2018 ("EMF Period") and collect from DEP's retail customers \$40,959,120 for REPS costs to be incurred during the rate period from December 1, 2018 through November 30, 2019 ("Billing Period"). The REPS rider and EMF will be in effect for the twelve month period December 1, 2018 through November 30, 2019.

8. Pursuant to the provisions of N.C. Gen. Stat. § 62-133.8 and Rule R8-67, DEP requests Commission approval of the annual billing statements, including both the REPS monthly charge and the EMF monthly charge, for each customer class as follows:

<b>Customer Class</b>	<b>REPS Monthly Charge</b> (excl. regulatory fee)	<b>Monthly EMF</b> (excl. regulatory fee)	<b>Total REPS Monthly Charge</b> (excl. regulatory fee)	<b>Total REPS Monthly Charge</b> (incl. regulatory fee)
Residential	\$ 1.30	\$ 0.12	\$ 1.42	\$ 1.42
General <sup>3</sup>	\$ 8.61	\$ (0.66)	\$ 7.95	\$ 7.96
Industrial	\$ 64.96	\$ 8.11	\$ 73.07	\$ 73.17

The calculation of these rates is set forth in Exhibit No. 4 of the direct testimony of Veronica I. Williams filed with this Application.

9. Pursuant to Commission Rule R8-67(e)(8), DEP requests approval to defer the difference between actual reasonable and prudently incurred incremental costs and

<sup>3</sup> Duke Energy Progress' General Service rate schedule generally covers the class of customers intended to be captured by the "Commercial" class included within N.C. Gen. Stat. § 62-133.8. The Company does not have a rate schedule for "Commercial" customers.

the related revenues realized under rates in effect. FERC account 182.3, "Other Regulatory Assets," will be used to defer these costs until recovered.

10. Further, pursuant to the provisions of N.C. Gen. Stat. § 62-133.8 and Commission Rule R8-67(c), the Company requests Commission approval of its 2017 REPS Compliance Report, attached as an exhibit to the direct testimony of Megan W. Jennings filed in support of this Application. As described by Ms. Jennings' testimony, and illustrated in DEP's 2017 REPS Compliance Report, the Company has complied with the requirements of N.C. Gen. Stat. § 62-133.8(b) and (d) for 2017. In its October 16, 2017 *Order Modifying the Swine and Poultry Waste Set-Aside Requirements and Providing Other Relief*, in Docket No. E-100, Sub 113, the Commission directed that the 2017 Poultry Waste Set-Aside requirement (N.C. Gen. Stat. § 62-133.8(f)) remain at the same level as the 2016 requirement, which the Commission had previously approved at 170,000 MWh, and delayed by one year the scheduled increases in that requirement. The Commission also further delayed for one year the Swine Waste Set-Aside requirement; accordingly, those requirements will now commence in compliance year 2018.<sup>4</sup> The Company has complied with this modified Poultry Waste Set-Aside requirement.

---

<sup>4</sup> In its *Order Modifying the Poultry and Swine Waste Set-Aside and Granting Other Relief* also issued in Docket No. E-100, Sub 113 (November 29, 2012), the Commission eliminated the Swine Waste Set-Aside requirement for 2012 and delayed for one year the Poultry Waste Set-Aside requirement (from 2012 to 2013). In its March 26, 2014 *Order Modifying the Poultry and Swine Waste Set-Aside Requirements and Providing Other Relief*, the Commission delayed the Swine and Poultry Waste Set-Aside requirements for an additional year, so that the Swine Waste Set-Aside requirements for 2014-2015 were 0.07 percent and the Poultry Waste Set-Aside requirement for 2014 was 170,000 MWh. In its November 13, 2014 *Order Modifying the Swine Waste Set-Aside Requirement and Providing Other Relief*, the Commission directed that the Swine Waste Set-Aside requirement remain at 0.07 percent for the years 2015-2016. Subsequently, in its December 1, 2015 *Order Modifying the Swine and Poultry Waste Set-Aside Requirements and Providing Other Relief*, the Commission directed that the Swine Waste Set-Aside requirement for 2015 be delayed an additional year and that the Poultry Waste Set-Aside requirement for 2015 would be the same as the 2014 level. In its October 17, 2016 *Order Modifying the Swine and Poultry Waste Set-Aside Requirements and Providing Other Relief*, the Commission directed that the 2016 Poultry Waste Set-Aside Requirement remain at the same level as the 2015 requirement and delayed by one year the scheduled

11. The information and data required to be filed under Commission Rule R8-67 is contained in the direct testimony and exhibits of witnesses Jennings and Williams, which are being filed simultaneously with this Application and incorporated herein by reference.

WHEREFORE, the Company respectfully requests:

That consistent with this Application, the Commission approves the Company's 2017 REPS Compliance Report and allows the Company to implement the rate riders as set forth above.

Respectfully submitted, this the 20<sup>th</sup> day of June, 2018.

**DIRECT TESTIMONY OF  
MEGAN W. JENNINGS**

1 **Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

2 A. My name is Megan W. Jennings, and my business address is 400 South  
3 Tryon Street, Charlotte, North Carolina.

4 **Q. PLEASE STATE YOUR POSITION WITH DUKE ENERGY AND**  
5 **DESCRIBE YOUR CURRENT RESPONSIBILITIES.**

6 A. In my capacity as Renewable Compliance Manager, I am responsible for  
7 the development and implementation of renewable energy compliance  
8 strategies for Duke Energy Progress, LLC (“Duke Energy Progress,”  
9 “DEP” or “the Company”), Duke Energy Carolinas, LLC (“DEC”) and  
10 Duke Energy Ohio, LLC. My responsibilities include compliance with  
11 renewable energy portfolio standard requirements and evaluation of  
12 renewable generation initiatives and customer programs.

13 **Q. PLEASE BRIEFLY SUMMARIZE YOUR EDUCATIONAL**  
14 **BACKGROUND.**

15 A. I received a Bachelor of Science degree in Mathematical Sciences from  
16 Clemson University and a Masters of Financial Mathematics from North  
17 Carolina State University.

18 **Q. PLEASE DESCRIBE YOUR BUSINESS BACKGROUND AND**  
19 **EXPERIENCE.**

20 A. I joined Progress Energy, Inc. in 2008, where I held positions in Investor  
21 Relations and Regulatory Planning. Following the merger of Progress  
22 Energy, Inc. with Duke Energy Corporation, I worked in the Rates and  
23 Regulatory Strategy Department until June of 2015, when I moved to my

1 current position as Renewable Compliance Manager in the Distributed  
2 Energy Technology Department.

3 **Q. HAVE YOU PREVIOUSLY TESTIFIED BEFORE THE NORTH**  
4 **CAROLINA UTILITIES COMMISSION?**

5 A. Yes, I most recently provided testimony in Docket No. E-7, Sub 1162 on  
6 DEC's 2017 REPS compliance report and application for approval of its  
7 REPS cost recovery rider and in Docket No. E-2, Sub 1144 on DEP's  
8 2016 REPS compliance report and application for approval of its REPS  
9 cost recovery rider.

10 **Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?**

11 A. The purpose of my testimony is to describe Duke Energy Progress'  
12 activities and the costs it has incurred, or will incur, in support of  
13 compliance with North Carolina's Renewable Energy and Energy  
14 Efficiency Portfolio Standard ("REPS") under N.C. Gen. Stat. ("G.S.") §  
15 62-133.8 during the twelve months beginning on April 1, 2017 and ending  
16 on March 31, 2018 ("Test Period"), as well as during the twelve months  
17 beginning on December 1, 2018 and ending on November 30, 2019  
18 ("Billing Period").

19 **Q. PLEASE DESCRIBE THE EXHIBITS TO YOUR TESTIMONY.**

20 A. My testimony includes ten exhibits: Jennings Confidential Exhibit No. 1 is  
21 the Company's 2017 REPS Compliance Report, and Jennings Confidential  
22 Exhibit No. 2 provides actual and forecasted REPS compliance costs, by  
23 resource, that the Company has incurred during the Test Period and

1 projects to incur during the Billing Period in support of compliance with  
2 REPS. Jennings Confidential Exhibit No. 3 is a worksheet detailing the  
3 other incremental costs included in this filing, listing separately labor and  
4 non-labor costs, as directed by the Commission in its order in Docket No.  
5 E-2, Sub 1109 (“2015 DEP REPS Compliance Order”). This exhibit does  
6 not include specific costs related to interconnection activities; they have  
7 been omitted per the NCUC’s order on January 17, 2017 in Docket E-2,  
8 Sub 1109. Jennings Exhibit Nos. 4-10 are the results of studies the costs of  
9 which the Company is recovering via the REPS Rider.

10 **Q. WERE THESE EXHIBITS PREPARED BY YOU OR AT YOUR**  
11 **DIRECTION AND UNDER YOUR SUPERVISION?**

12 A. Jennings Confidential Exhibit Nos. 1-3 were prepared by me or under my  
13 supervision. Jennings Exhibit Nos. 4-10 include the results of studies not  
14 prepared under my supervision. However, in my role at Duke Energy, I  
15 am familiar with the studies.

16 **Compliance with REPS Requirements**

17 **Q. WHAT ARE DUKE ENERGY PROGRESS’ REPS**  
18 **REQUIREMENTS UNDER G.S. § 62-133.8?**

19 A. Pursuant to G.S. § 62-133.8,<sup>1</sup> as an electric power supplier, Duke Energy  
20 Progress is required to comply with the overall REPS requirement (“Total  
21 Requirement”) by submitting for retirement a total volume of renewable

---

<sup>1</sup> In its *Order Clarifying Electric Power Suppliers’ Annual REPS Requirements*, Docket No. E-100, Sub 113 (November 26, 2008), the Commission clarified that the calculation of these requirements for each year shall be based upon the electric utility’s North Carolina retail sales for the prior year.

1 energy certificates (“RECs”) equivalent to the following percentages of its  
2 North Carolina retail sales in the prior year:

- 3       ▪ Beginning in 2012, three percent (3%);
- 4       ▪ In 2015, six percent (6%);
- 5       ▪ In 2018, ten percent (10%); and
- 6       ▪ In 2021 and thereafter, twelve point five percent (12.5%).

7           Furthermore, each electric power supplier must comply with the  
8 requirements of G.S. §§ 62-133.8 (d), (e), and (f) (individually referred to  
9 as the “Solar Set-Aside,” “Swine Waste Set-Aside,” and “Poultry Waste  
10 Set-Aside,” respectively). That is, within the Total Requirement described  
11 above, each electric power supplier is to ensure that specific quantities of  
12 qualifying solar RECs, swine waste RECs, and poultry waste RECs are  
13 also submitted for retirement. The Company generally refers to its Total  
14 Requirement net of the three set-asides as its “General Requirement.”

15           Specifically, each electric power supplier is to comply with the  
16 Solar Set-Aside by submitting for retirement a volume of qualifying solar  
17 RECs equivalent to the following percentages of its North Carolina retail  
18 sales in the prior year:

- 19       ▪ Beginning in 2010, two-hundredths of one percent (0.02%);
- 20       ▪ In 2012, seven-hundredths of one percent (0.07%);
- 21       ▪ In 2015, fourteen-hundredths of one percent (0.14%); and
- 22       ▪ In 2018 and thereafter, two-tenths of one percent (0.2%).

1           Each electric power supplier is also to comply with the Swine  
2           Waste Set-Aside by submitting for retirement a volume of qualifying  
3           swine waste RECs equivalent to its pro-rata share of total retail electric  
4           power sold in North Carolina multiplied by the statewide, aggregate swine  
5           waste set-aside requirement.<sup>2</sup> Duke Energy Progress' Swine Waste Set-  
6           Aside requirements, as modified by the Commission,<sup>3</sup> are as follows:

- 7           ▪ In 2018, its pro-rata share of seven-hundredths of one percent  
8           (0.07%) of the total retail electric power sold in North Carolina in  
9           the year prior;
- 10          ▪ In 2020, its pro-rata share of fourteen-hundredths of one percent  
11          (0.14%) of total retail electric power sold in North Carolina in the  
12          year prior; and
- 13          ▪ In 2023 and thereafter, its pro-rata share of two-tenths of one  
14          percent (0.2%) of total retail electric power sold in North Carolina  
15          in the year prior.

16           Finally, each electric power supplier is also to submit for  
17           retirement a volume of qualifying poultry waste RECs equivalent to its

---

<sup>2</sup> In its *Order on Pro Rata Allocation of Aggregate Swine and Poultry Waste Set-Aside Requirements and Motion for Clarification* in Docket No. E-100, Sub 113 (March 31, 2010), the Commission approved the electric power suppliers' proposed pro-rata allocation of the statewide aggregate swine and poultry waste set-aside requirements, such that the aggregate requirements will be allocated among the electric power suppliers based on the ratio of each electric power supplier's prior year retail sales to the total statewide retail sales.

<sup>3</sup> In its *Order Modifying the Swine and Poultry Waste Set-Aside Requirements And Providing Other Relief* (October 16, 2017), and its *Errata Order* (December 15, 2017), Docket No. E-100, Sub 113, the Commission further delayed for one year the Swine Waste Set-Aside requirement; accordingly, the Swine Waste compliance requirements will now commence in compliance year 2018. The Commission also modified the 2017 Poultry Waste Set-Aside requirement to remain at the same level as the 2016 requirement, and delayed by one year the scheduled increases in the requirement.

1 pro-rata share of the aggregate state-wide poultry waste set-aside  
2 requirement. Duke Energy Progress' Poultry Waste Set-Aside  
3 requirements, as modified by the Commission, are as follows:

- 4       ▪ Beginning in 2014, its pro-rata share of 170,000 megawatt-hours  
5           ("MWh");
- 6       ▪ In 2018, its pro-rata share of 700,000 MWh; and
- 7       ▪ In 2019 and thereafter, its pro-rata share of 900,000 MWh.

8           The requirements that are described in this testimony and  
9       accompanying exhibits reflect the aggregation of the REPS requirements  
10      of Duke Energy Progress' retail customers as well as those wholesale  
11      customers, specifically the Town of Sharpsburg, the Town of  
12      Stantonsburg, the Town of Lucama, the Town of Black Creek and the  
13      Town of Winterville (collectively "Wholesale"), for which the Company  
14      has been contracted to provide REPS services.

15 **Q. PLEASE DISCUSS DUKE ENERGY PROGRESS' REPS**  
16 **REQUIREMENTS FOR THE TEST AND BILLING PERIODS.**

17 A. For the Test Period, the Company submitted for retirement 2,210,451  
18 RECs, which included 16,358 Senate Bill 886 ("SB 886") RECs, each of  
19 which counts for two poultry waste and one general REC, to meet its Total  
20 Requirement of 2,243,167 RECs. Within this total, the Company  
21 submitted for retirement 52,344 RECs to meet the Solar Set-Aside  
22 requirement and 15,358 RECs, along with 16,358 SB 886 RECs (which  
23 count as 32,716 Poultry Waste Set-Aside RECs), to meet the Poultry

1 Waste Set-Aside requirement. During the prospective Billing Period,  
2 which spans two calendar years, with different requirements in each year,  
3 the Company's estimated requirements are as follows<sup>4</sup>:

4 In 2018, the Company estimates that it will be required to submit  
5 for retirement 3,682,990 RECs to meet its Total Requirement. Within this  
6 total, the Company is also required to retire the following: 73,660 solar  
7 RECs, 25,781 swine waste RECs and 197,318 poultry waste RECs.

8 In 2019, the Company estimates that it will be required to submit  
9 for retirement 3,724,847 RECs to meet its Total Requirement. Within this  
10 total, the Company estimates that it will be required to retire  
11 approximately 74,497 solar RECs, 26,074 swine waste RECs and 253,695  
12 poultry waste RECs.

13 **Q. HAS THE COMPANY COMPLIED WITH ITS GENERAL**  
14 **REQUIREMENT FOR 2017?**

15 A. Yes, the Company has met its 2017 General Requirement of 2,142,749  
16 RECs. Specifically, the RECs to be used for 2017 compliance have been  
17 transferred from the North Carolina Renewable Energy Tracking System  
18 ("NC-RETS") Progress Energy Electric Power Supplier account to the  
19 Progress Energy Compliance Sub-Account and the Sub-Accounts of its  
20 Wholesale customers. Upon completion of this regulatory proceeding, the  
21 Commission will finalize retirement of the RECs.

---

<sup>4</sup> The Company's projected requirements are based upon retail sales estimates and will be subject to change based upon actual prior year North Carolina retail sales data.

1 **Q. WILL THE COMPANY COMPLY WITH ITS GENERAL REPS**  
2 **REQUIREMENT IN 2018?**

3 A. Yes, the Company is well positioned to comply with its General REPS  
4 Requirements in 2018.

5 **Q. WHAT ACTIONS HAS THE COMPANY TAKEN DURING THE**  
6 **TEST PERIOD TO SATISFY ITS CURRENT AND FUTURE REPS**  
7 **REQUIREMENTS?**

8 A. During the Test Period, Duke Energy Progress has continued to produce  
9 and procure RECs to satisfy its REPS requirements. Specifically, the  
10 Company has taken the following actions: (1) executed and continued  
11 negotiations for additional REC purchase agreements with renewable  
12 facilities; (2) solicited renewable energy proposals of various types; (3)  
13 continued operations of its solar facilities; (4) enhanced and expanded  
14 energy efficiency programs that will generate savings that can be counted  
15 towards the Company's REPS requirement; and (5) performed research  
16 studies, both directly and through strategic partnerships, to enhance the  
17 Company's ability to comply with its future REPS requirements.

18 **Q. HOW WILL THE COMPETITIVE PROCUREMENT OF**  
19 **RENEWABLE ENERGY ("CPRE") PROGRAM OF NORTH**  
20 **CAROLINA HOUSE BILL 589 ("NC HB 589") IMPACT DEP'S**  
21 **COMPLIANCE WITH ITS GENERAL REQUIREMENT?**

22 A. Under G.S. § 62-110.8(a), DEC and DEP (the "Companies") are  
23 responsible for procuring renewable energy and capacity through a

1 competitive procurement program with the purpose of adding renewable  
2 energy to the state's generation portfolio in a manner that allows DEC and  
3 DEP to continue to reliably and cost-effectively serve their customers'  
4 future energy needs. To meet the CPRE Program requirements, the  
5 Companies must issue requests for proposals to procure energy and  
6 capacity from renewable energy facilities in the aggregate amount of  
7 2,660 MW (subject to adjustment in certain circumstances) reasonably  
8 allocated over a term of 45 months beginning on February 21, 2018, when  
9 the Commission approved the CPRE Program.

10 Renewable energy facilities eligible to participate in the CPRE  
11 solicitation(s) include those facilities that use renewable energy resources  
12 identified in G.S. § 62-133.8(a)(8), the REPS statute. The renewable  
13 energy facilities to be developed or acquired by the Companies or  
14 procured from a third party through a power purchase agreement under the  
15 CPRE Program, must also deliver to the Companies the environmental and  
16 renewable attributes, or RECs, associated with the power. The Company's  
17 CPRE Program Guidelines, filed in Docket No. E-2, Sub 1159 on  
18 November 27, 2017, include a planned allocation of the 2,660 MW  
19 between the DEC and DEP service territories and a proposed timeline for  
20 each solicitation. DEP plans to use the RECs acquired through the CPRE  
21 RFP solicitations for its future REPS compliance requirements and has  
22 therefore included the planned MW allocation and timeline in its REPS  
23 compliance planning process. Because the Company will use the RECs

1           acquired through CPRE for REPS compliance, CPRE program  
2           implementation costs could be recovered through the REPS Rider.  
3           However, the Company has elected to recover the reasonable and prudent  
4           costs incurred to implement the CPRE Program through the CPRE Rider  
5           as contemplated under Commission Rule R8-71(j).

6   **Q.   HAS THE COMPANY COMPLIED WITH ITS SOLAR SET-ASIDE**  
7   **REQUIREMENT FOR 2017?**

8   A.   Yes, the Company has met the 2017 Solar Set-Aside requirement of  
9           52,344 solar RECs. Pursuant to the NC-RETS Operating Procedures, the  
10          Company has submitted for retirement 52,344 solar RECs. Specifically,  
11          the RECs to be used for 2017 compliance have been transferred from the  
12          NC-RETS Progress Energy Electric Power Supplier account to the  
13          Progress Energy Compliance Sub-Account and the Sub-Accounts of its  
14          Wholesale customers. Upon completion of this regulatory proceeding, the  
15          Commission will finalize retirement of the RECs.

16   **Q.   WILL THE COMPANY COMPLY WITH ITS SOLAR SET-ASIDE**  
17   **REQUIREMENT IN 2018?**

18   A.   Yes, the Company is well positioned to comply with its Solar Set-Aside  
19          requirement in 2018.

20   **Q.   PLEASE PROVIDE AN UPDATE ON THE COMPANY'S**  
21   **EFFORTS TO COMPLY WITH ITS SOLAR SET-ASIDE**  
22   **REQUIREMENT.**

1 A. The Company is well positioned to comply with its Solar Set-Aside  
2 Requirement in 2018 through a diverse and balanced portfolio of solar  
3 resources. The Company's efforts to comply with the Solar Set-Aside  
4 Requirement include REC generation and procurement from solar  
5 renewable energy facilities.

6 **Q. HAS THE COMPANY COMPLIED WITH ITS POULTRY WASTE  
7 SET-ASIDE REQUIREMENT FOR 2017?**

8 A. Yes, the Company has met the 2017 Poultry Waste requirement of  
9 48,074 RECs. Pursuant to NC-RETS Operating Procedures, the Company  
10 has submitted for retirement 15,358 poultry RECs and 16,358 SB 886  
11 RECs (which count as 32,716 Poultry Waste Set-Aside  
12 RECs). Accordingly, the Company has submitted the equivalent of 48,074  
13 poultry RECs for compliance. Specifically, the RECs to be used for 2017  
14 compliance have been transferred from the NC-RETS Progress Energy  
15 Electric Power Supplier account to the Progress Energy Compliance Sub-  
16 Account and the Sub-Accounts of its Wholesale customers. Upon  
17 completion of this regulatory proceeding, the Commission will finalize  
18 retirement of the RECs.

19 **Q. WILL THE COMPANY COMPLY WITH ITS POULTRY WASTE  
20 SET-ASIDE REQUIREMENT IN 2018?**

21 A. The Company is in a position to comply with its poultry waste set-aside  
22 requirement in 2018, though future compliance is dependent on the  
23 performance of poultry waste-to-energy developers on current contracts.

1    **Q.    WHAT ACTIONS HAS THE COMPANY TAKEN DURING THE**  
2           **TEST PERIOD TO PROCURE OR DEVELOP POULTRY WASTE-**  
3           **TO-ENERGY RESOURCES TO SATISFY ITS POULTRY WASTE**  
4           **SET-ASIDE REQUIREMENTS?**

5    A.    In the Test Period, the Company (1) continued direct negotiations for  
6           additional supplies of both in-state and out-of-state resources with  
7           multiple counterparties; (2) secured contracts for additional poultry waste-  
8           to-energy resources; (3) worked diligently to understand the technological,  
9           permitting, and operational risks associated with various methods of  
10          producing qualifying poultry RECs to aid developers in overcoming those  
11          risks; when those risks could not be overcome, the Company worked with  
12          developers via contract amendments to adjust for more realistic outcomes;  
13          (4) explored leveraging current biomass contracts by working with  
14          developers to add poultry waste to their fuel mix; (5) explored adding  
15          thermal capabilities to current poultry sites to bolster REC production; (6)  
16          utilized the Company's REC trader to search the broker market for out-of-  
17          state poultry RECs available in the market; (7) participated in the North  
18          Carolina Energy Policy Council Biogas Working Group; and (8)  
19          terminated non-performing contracts. Additional information on the  
20          Company's compliance with the Poultry Waste Set-Aside requirement can  
21          be found in the Company's Joint Semiannual Progress Report, filed on  
22          May 31, 2018 in Docket No. E-100, Sub 113A.

1           The Company remains committed to satisfying its statutory  
2 requirements for the Poultry Waste Set-Aside and will continue to  
3 reasonably and prudently pursue procurement of these resources.

4 **Q. WILL THE COMPANY COMPLY WITH ITS SWINE WASTE**  
5 **SET-ASIDE REQUIREMENT IN 2018?**

6 A. The Company projects that it will not comply with its Swine Waste Set-  
7 Aside in 2018. The Company's ability to meet its Swine Waste Set-Aside  
8 is adversely impacted by the performance of swine waste-to-energy  
9 developers on current contracts and delays in swine waste-to-energy  
10 developers becoming commercially operational on new contracts with the  
11 Company. The Company understands that current swine waste-to-energy  
12 projects have encountered difficulties in achieving the full REC output of  
13 their contracts due to the inability to secure firm and reliable sources of  
14 swine waste feedstock from waste producers in North Carolina, difficulties  
15 securing project financing and technological challenges encountered when  
16 ramping up production.

17           The Company notes that its good-faith efforts to comply with the  
18 swine waste set-aside now include, however, the first swine-derived  
19 biogas project in North Carolina, Optima KV. Optima KV successfully  
20 interconnected with Piedmont Natural Gas in March 2018 and is sending  
21 biogas to DEP's Smith Energy Complex where swine RECs are generated.

22 **Q. WHAT ACTIONS HAS THE COMPANY TAKEN DURING THE**  
23 **TEST PERIOD TO PROCURE OR DEVELOP SWINE WASTE-TO-**

1           **ENERGY RESOURCES TO MEET ITS SWINE WASTE SET-**  
2           **ASIDE REQUIREMENTS?**

3    A.    In the Test Period, the Company (1) issued a Request for Proposals for  
4           swine waste fueled proposals, soliciting up to 750,000 MMBtu of swine  
5           waste fueled biogas, or the equivalent in MWh, which is approximately  
6           110,000 MWh, of electric power fueled by swine waste; (2) continued  
7           direct negotiations for additional supplies of both in-state and out-of-state  
8           resources; (3) secured contracts for additional swine waste-to-energy  
9           resources; (4) worked diligently to understand the technological,  
10          permitting, and operational risks associated with various methods of  
11          producing qualifying swine waste RECs to aid developers in overcoming  
12          those risks; when those risks could not be overcome, the Company worked  
13          with developers via contract amendments to adjust for outcomes that the  
14          developers believe are achievable based on new experience; (5) explored  
15          and is engaging in modification of current biomass and set-asides  
16          contracts by working with developers to add swine waste to their fuel mix;  
17          (6) actively negotiated contracts for the ability to generate RECs from  
18          swine-derived directed biogas at the H.F. Lee, Smith or Sutton combined  
19          cycle plants for combustion and generation of zero emission renewable  
20          electricity; (7) utilized the Company's REC trader to search the broker  
21          market for out-of-state swine RECs available in the market; (8)  
22          participated in the North Carolina Energy Policy Council Biogas Working  
23          Group; (9) engaged the North Carolina Pork Council ("NCPC") in a

1 project evaluation collaboration effort that will allow the Company and the  
2 NCPC to discuss project viability, as appropriate, with respect to the  
3 Company's obligations to keep certain sensitive commercial information  
4 confidential; and (10) terminated non-performing contracts. Additional  
5 information on the Company's compliance with the Swine Waste Set-  
6 Aside requirement can be found in the Company's Joint Semiannual  
7 Progress Report, filed on May 31, 2018 in Docket No. E-100, Sub 113A.

8 The Company remains committed to satisfying its statutory  
9 requirements for the Swine Waste Set-Aside and will continue to  
10 reasonably and prudently pursue procurement of these resources.

11 **Q. IS DUKE ENERGY PROGRESS CONTINUING TO EXECUTE**  
12 **ADDITIONAL REC PURCHASE AGREEMENTS?**

13 A. Yes, the Company continues to execute additional REC purchase  
14 agreements and maintains an open solicitation for proposals from  
15 developers of renewable energy resources.

16 **Q. DID THE COMPANY SELL ANY RECS DURING THE TEST**  
17 **PERIOD?**

18 A. No, it did not.

19 **Costs of REPS Compliance**

20 **Q. WHAT ARE THE COMPANY'S COSTS ASSOCIATED WITH**  
21 **REPS COMPLIANCE DURING THIS TEST PERIOD AND THE**  
22 **UPCOMING BILLING PERIOD?**

1 A. Duke Energy Progress' costs associated with REPS compliance are  
2 reflected in Jennings Confidential Exhibit No. 2 and are categorized by  
3 actual costs incurred during the Test Period and projected costs for the  
4 Billing Period.

5 **Q. IN ADDITION TO RENEWABLE ENERGY AND REC COSTS,**  
6 **WHAT OTHER COSTS OF REPS COMPLIANCE DOES THE**  
7 **COMPANY SEEK TO RECOVER IN THIS PROCEEDING?**

8 A. Jennings Confidential Exhibit No. 2 identifies "Other Incremental Costs"  
9 and "Research" that the Company has incurred in association with REPS  
10 compliance.

11 **Other Incremental Costs and Solar Rebate Program Costs**

12 **Q. PLEASE EXPLAIN THE OTHER INCREMENTAL COSTS**  
13 **INCLUDED FOR RECOVERY.**

14 A. Other Incremental Costs include labor costs associated with REPS  
15 compliance activities and non-labor costs associated with administration  
16 of REPS compliance. Among the non-labor costs associated with REPS  
17 are the Company's subscription to NC-RETS, and accounting, tracking,  
18 and forecasting tools related to RECs, reduced by agreed-upon liquidated  
19 damages paid by sellers for failure to meet contractual milestones, and  
20 amounts for administrative contractual amendments requested by sellers.

21 **Q. PLEASE PROVIDE INFORMATION ON THE NC HB 589 SOLAR**  
22 **REBATE PROGRAM.**

1 A. As required by G.S. § 62-155(f), DEC and DEP filed an application with  
2 the NCUC, in Docket Nos. E-7, Sub 1166 and E-2, Sub 1167, requesting  
3 approval of a Solar Rebate Program offering reasonable incentives to  
4 residential and nonresidential customers for the installation of small  
5 customer owned or leased solar energy facilities participating in the  
6 Company's net metering tariff. The incentive is limited to 10 kilowatts  
7 alternating current ("kW AC") for residential solar installations and 100  
8 kW AC for nonresidential solar installations. The program incentive shall  
9 be limited to 10,000 kW of installed capacity annually starting January 1,  
10 2018 and continuing until December 31, 2022. Under NC HB 589, DEP  
11 shall be authorized to recover all reasonable and prudent costs of  
12 incentives provided to customers and program administrative costs  
13 through the REPS Rider.

14 **Q. ARE COSTS RELATED TO THE NC HB 589 SOLAR REBATE**  
15 **PROGRAM INCLUDED FOR RECOVERY IN THIS FILING?**

16 A. Yes. Pursuant to G.S. § 62-155(f), each public utility required to offer a  
17 solar rebate program "shall be authorized to recover all reasonable and  
18 prudent costs of incentives provided to customers and program  
19 administrative costs by amortizing the total program incentives distributed  
20 during a calendar year and administrative costs over a 20-year period,  
21 including a return component adjusted for income taxes at the utility's  
22 overall weighted average cost of capital established in its most recent  
23 general rate case, which shall be included in the costs recoverable by the

1 public utility pursuant to G.S. § 62-133.8(h).” G.S. § 62-133.8(h) provides  
2 for an electric power supplier’s cost recovery and customer charges under  
3 the REPS statute; NC HB 589 amended it by adding a provision to allow  
4 for the recovery of incremental costs incurred to “provide incentives to  
5 customers, including program costs, incurred pursuant to G.S. § 62-  
6 155(f).” Therefore, DEP has included for recovery in this filing costs  
7 projected to be incurred in the Billing Period related to the implementation  
8 of the NC HB 589 Solar Rebate Program. As detailed on Jennings  
9 Confidential Exhibit No. 3, these costs include the annual amortization of  
10 incentives paid to customers, return on the unamortized balance, and  
11 program administration costs, including labor, information technology and  
12 marketing costs.

13 **Q. PLEASE PROVIDE DETAIL ON THE NON-LABOR COSTS**  
14 **ASSOCIATED WITH THE NC HB 589 SOLAR REBATE**  
15 **PROGRAM.**

16 A. The NC HB 589 Solar Rebate Program is anticipated to launch in July  
17 2018 with the first rebate payments occurring in August 2018. Even  
18 though the rebate payments are not projected to start until August 2018,  
19 DEP anticipates the program to be fully subscribed in 2018 with payments  
20 for the full annual limit of 10,000 kW. In 2019, the rebate payments are  
21 projected to be made ratably throughout the year. Also included in non-  
22 labor costs are program marketing costs and information technology costs  
23 for the automation of program administrative tasks.

1 **Q. PLEASE PROVIDE DETAIL ON THE INTERNAL LABOR COSTS**  
2 **ASSOCIATED WITH THE NC HB 589 SOLAR REBATE**  
3 **PROGRAM.**

4 A. The labor dollars related to the NC HB 589 Solar Rebate Program  
5 included for recovery in this filing include projected costs for one Program  
6 Manager, two Program Specialists and two complex billing staff. The  
7 Program Manager will be responsible for marketing, installer  
8 communications, reporting and overseeing the Program Specialists, who  
9 will be responsible for processing applications, initiating incentive  
10 payments and handling customer inquiries. In addition, incremental  
11 employees are needed in complex billing as the number of net metering  
12 accounts is expected to increase as a result of the NC HB 589 Solar Rebate  
13 Program.

14 **Q. PLEASE PROVIDE DETAIL ON THE INTERNAL LABOR COSTS**  
15 **THAT ARE ASSOCIATED WITH REPS COMPLIANCE AND**  
16 **SOLAR REBATE ACTIVITIES THAT ARE INCLUDED IN DEP'S**  
17 **CURRENT APPLICATION FOR REPS COST RECOVERY.**

18 A. DEP charges only the incremental cost of REPS compliance and the NC  
19 HB 589 Solar Rebate Program to the REPS cost recovery rider. Consistent  
20 with that policy and DEP's practices in previous applications for cost  
21 recovery for REPS compliance, internal employees who work to comply  
22 with G.S. § 62-133.8 and G.S. § 62-155(f) charge only that portion of their

1 labor to REPS. The departments/functions that charged labor to REPS  
2 during the Test Period are detailed in Jennings Confidential Exhibit No. 3.

3 **Q. HOW DO EMPLOYEES CHARGE THEIR REPS-RELATED AND**  
4 **NC HB 589 SOLAR REBATE PROGRAM-RELATED LABOR**  
5 **COSTS TO REPS?**

6 A. Employees positively report their time, which means that each employee  
7 is required to submit a timesheet every two weeks in DEP's time reporting  
8 system. The hours reported for the period are split according to the  
9 accounting entered in the time reporting system for that specific employee.  
10 The division of hours is updated for the reporting period as necessary, as  
11 the nature of the employee's work changes.

12 To educate employees to account for their time properly, DEP  
13 annually provides instructions for charging time to REPS to affected  
14 employees and the management of the employee groups performing REPS  
15 work. Additionally, every year prior to filing for approval of the DEP  
16 REPS Compliance Report and Cost-Recovery Rider, the labor hours  
17 charged are carefully reviewed and confirmed.

18 **Q. ARE THERE ANY LABOR AND NON-LABOR**  
19 **INTERCONNECTION-RELATED COSTS INCLUDED FOR**  
20 **RECOVERY IN THIS FILING?**

21 A. No. As directed by the NCUC in the *2015 DEP REPS Compliance Order*,  
22 all internal interconnection-related labor costs, such as those related to  
23 employees in the Distributed Energy Technology Standard PPAs and

1 Interconnection Team and the Renewables Service Center, contract labor  
2 costs, such as those for temporary employees working on interconnection  
3 information technology projects, and non-labor costs, such as PowerClerk  
4 platform costs, have not been included for recovery in this filing.

#### 5 Research Costs

6 With respect to Research and Development (“R&D”) activities during the  
7 Test Period and projected for the Billing Period, the Company has  
8 incurred or projects to incur costs associated with the support of various  
9 pilot projects and studies related to distributed energy technology and the  
10 Company’s REPS compliance.

11 **Q. THE COMMISSION’S ORDER APPROVING REPS AND REPS**  
12 **EMF RIDERS AND 2012 REPS COMPLIANCE REQUIRES DUKE**  
13 **ENERGY PROGRESS TO FILE WITH ITS 2017 REPS RIDER**  
14 **APPLICATION STUDY RESULTS FOR ANY STUDIES THE**  
15 **COSTS OF WHICH IT HAS RECOVERED VIA THE REPS**  
16 **RIDER. IS THE COMPANY SUPPLYING SUCH STUDIES IN**  
17 **THIS FILING?**

18 A. Yes. The Company’s R&D efforts are an integral part of its REPS  
19 compliance efforts. The following summary outlines efforts undertaken by  
20 the Company in the test period and specifies the availability of applicable  
21 study results.

- 22 • CAPER, PV Synchronous Generator (“PVSG”) – In 2017, the  
23 Company worked with North Carolina State University (“NC

1 State”) and Clemson University, through the Center for Advanced  
2 Power Engineering Research (“CAPER”), on a project to develop  
3 and demonstrate a 40 kW PVSG system. The results of this project  
4 can be found in Jennings Exhibit No. 4. This project will continue  
5 in 2018.

6 • CAPER, Distributed Generation Valuation – In 2017, the  
7 Company worked with NC State and the University of North  
8 Carolina at Charlotte (“UNCC”), through CAPER, on a project to  
9 properly value the distributed generation in relation to its impacts  
10 on the grid, and to determine best practices for the southeast  
11 region. The first phase of the project aims to review recently  
12 conducted studies on the value of distributed generation. The phase  
13 one results can be found in Jennings Exhibit No. 5. This project  
14 will continue in 2018.

15 • Coalition for Renewable Natural Gas – the Company joined the  
16 Coalition for Renewable Natural Gas in 2017 to add a valuable  
17 resource of knowledge and public policy advocacy in this  
18 growing sector of potential animal waste supply. The Coalition for  
19 Renewable Natural Gas provides its members with exclusive  
20 whitepapers, support on model pipeline gas specifications and  
21 access to other members for discussions on current and future  
22 projects.

- 1           • eLab – Rocky Mountain Institute (“RMI”) – The Company  
2           participates in eLab, a forum sponsored by RMI, composed of a  
3           number of North Carolina and nationally based entities, and  
4           organized to overcome barriers to economic deployment of  
5           distributed energy resources in the U.S. electric sector.  
6           Specifically, the Company seeks to gauge customer desires related  
7           to distributed resources and provide ideas of potential long-term  
8           solutions for distributed energy resources and microgrids. Please  
9           visit RMI’s website at <http://www.rmi.org/elab> for more  
10          information on eLab.
- 11          • Electric Power Research Institute (“EPRI”) – In 2017, the  
12          Company subscribed to the following EPRI programs, the costs of  
13          which were recovered via the REPS rider: Program 193 –  
14          Renewable Generation, which includes Program PS193C – Solar.  
15          EPRI designates such study results as proprietary or as trade  
16          secrets and licenses such results to EPRI members,  
17          including Duke Energy Progress. As such, the Company may not  
18          disclose the information publicly. Non-members may access these  
19          studies for a fee. Information regarding access to this information  
20          can be found at <http://www.epri.com/Pages/Default.aspx>.
- 21          • Eos Energy Storage Technology Demonstration – The company  
22          and Eos Services started a collaborative technology development  
23          program to validate, demonstrate, and quantify the benefits of an

1 Eos Aurora Battery System that is DC Coupled to a PV facility at  
2 the McAlpine Creek Substation 50 kW Solar Facility. The  
3 expected completion date of the project is the end of 2019.

4 • NC State University’s Future Renewable Electric Energy Delivery  
5 and Management (“FREEDM”) Systems Center – Duke Energy  
6 supports NC State’s FREEDM Center through annual membership  
7 dues. The FREEDM partnership provides Duke Energy with the  
8 ability to influence and focus research on materials, technology,  
9 and products that will enable the utility industry to transform the  
10 electric grid into a two-way power flow system supporting  
11 distributed generation.

12 • Institute for Electrical and Electronics Engineers (“IEEE”) 1547  
13 Conformity Assessment – The IEEE 1547 Conformity Assessment  
14 Steering Committee has been working to develop industry standard  
15 tools and methodologies to assure consistent and comprehensive  
16 compliance prior to utility grid interconnection sign off. IEEE and  
17 the Company share a common goal to accelerate and broaden  
18 industry adoption through the development and publication of  
19 well-designed and managed conformity assessment and  
20 certification programs. This project was about establishment and  
21 execution of an IEEE 1547 Commissioning Test demonstration for  
22 solar installations within the eGRID laboratory located at Clemson  
23 University. The project formally commissioned the operation of a

1           50kW inverter and established an operational test bed for more  
2           advanced interconnection evaluation. The results of this project  
3           can be found in Jennings Confidential Exhibit No. 6.

4           • Distributed Energy Resource – Islanding Detection and Control  
5           (“DER-IDC”) – There is growing consensus in the industry that as  
6           DER grows in its penetration levels, the effectiveness of anti-  
7           islanding schemes currently in use in inverters and protective  
8           relaying schemes will degrade, and that future schemes will likely  
9           need to involve some sort of communications. This sentiment has  
10          been discussed multiple times at recent IEEE working group  
11          meetings, at which the Company is an active participant. To that  
12          end, DEP engaged in an initial study to look at wide-scale  
13          communications methods that could be used to solve this growing  
14          concern. DEP contracted with Northern Plains Power Technologies  
15          (“NPPT”), an engineering consulting firm, to study data collected  
16          from Duke Energy facilities and research potential algorithms and  
17          communications methods that would be effective for  
18          communications-based IDC methods. In 2017, NPPT evaluated the  
19          technical challenges of the identified islanding detection method,  
20          and presented the feasible alternatives. The results of the study can  
21          be found in Jennings Confidential Exhibit No. 7. In addition, DEP  
22          contracted with Green Energy Corp. who developed the data  
23          translator for local access and filtering of streaming Phasor

1 Measurement Unit data at distribution measurement equipment  
2 back to a phasor data concentrator in the back-office. A status  
3 report for this project can be found in Jennings Exhibit No. 8.

4 • Marshall Solar Site Algorithm – In 2017, the Company worked  
5 with UNCC on a project to utilize the operational data to design  
6 and implement an autonomous active and reactive power dispatch  
7 algorithm with PV farms and/or Battery Energy Storage system on  
8 any feeder considering DMS coordination. The results of this  
9 project can be found in Jennings Confidential Exhibit No. 9.

10 • Mini-DVAR Project – In 2016, the Company started a project to  
11 investigate a new technology manufactured by American  
12 Superconductor Corporation which makes a device called Mini-  
13 DVAR. This device can potentially be used for voltage  
14 stability/VAR support for renewable energy applications such as  
15 voltage compliance, grid reliability, efficiency, energy savings and  
16 grid integration of distributed PV. The project also included  
17 engineering design of a protection scheme with Schweitzer  
18 Engineering Laboratories, and the procurement of switch gear  
19 from ABB. In 2017, the Company completed the following tasks  
20 of the project: (1) power quality meter installation for base line  
21 data collection; (2) design and implementation of the direct  
22 transfer trip for the mini-DVAR device; (3) mini-DVAR device  
23 field installation and commissioning; and (4) test run of the mini-

1 DVAR to verify it's fully functional. This project will continue in  
2 2018.

3 • Swine Extrusion/Poultry Mortality – The Animal and Poultry  
4 Waste Management Center (“APWMC”) at NC State University –  
5 In 2017, the Company began support of the various projects being  
6 undertaken by the APWMC. The initial work is centered around  
7 drying swine lagoon solids and poultry mortalities at a farm-based  
8 level to create a higher MMBtu fuel that can be safely and easily  
9 transported to a central plant for combustion. A detailed  
10 description of the project along with future testing plans can be  
11 found in Jennings Confidential Exhibit No. 10.

12 **Q. ARE YOU SATISFIED THAT THE ACTUAL COSTS INCURRED**  
13 **IN THE TEST PERIOD HAVE BEEN, AND THAT THE**  
14 **PROJECTED COSTS OF THE BILLING PERIOD WILL BE,**  
15 **PRUDENTLY INCURRED?**

16 A. Yes. Duke Energy Progress believes it has incurred and projects to incur  
17 all of these costs associated with REPS compliance in a prudent manner.  
18 The Company continues to exercise thorough and rigorous technical and  
19 economic analysis to evaluate all options for compliance with its REPS  
20 requirements. Duke Energy Progress has developed strong foundational  
21 market knowledge related to renewable resources. The Company  
22 continues to enhance and develop expertise in this field through the  
23 Company's various solicitations for renewable energy and the operation of

1 its unsolicited bid process, its participation in industry research, and daily  
2 interaction with developers of renewable energy facilities. As a result of  
3 these efforts, the Company has been able to identify, procure, and develop  
4 a diverse portfolio of renewable resources to meet its REPS requirements  
5 in a prudent, reasonable and cost-effective manner.

6 **Q. DOES THIS CONCLUDE YOUR TESTIMONY?**

7 A. Yes.

(A) **INTRODUCTION**

Duke Energy Progress, LLC (“Duke Energy Progress” or the “Company”) submits its Renewable Energy and Energy Efficiency Portfolio Standard (“REPS”) Compliance Report (“Compliance Report”) in accordance with N.C. Gen. Stat. § 62-133.8 and Commission Rule R8-67(c). This Compliance Report provides the required information for the calendar year 2017.<sup>1</sup>

This Compliance Report provides the required information in aggregate for the Company and the following wholesale customers for which the Company provided renewable energy resources and compliance reporting services for 2017: Town of Black Creek, the Town of Lucama, the Town of Sharpsburg, the Town of Stantonsburg, and the Town of Winterville (“Wholesale”).

(B) **REPS COMPLIANCE REPORT**

I. **RENEWABLE ENERGY CERTIFICATES:**

The table below reflects the renewable energy certificates (“RECs”) used to comply with N.C. Gen. Stat. § 62-133.8(d) for the year 2017.

[END CONFIDENTIAL]

<sup>1</sup> Pursuant to NCUC Rule R8-67(c)(1), this Compliance Report reflects Duke Energy Progress’ efforts to meet the REPS requirements for the previous calendar year.

**II. ACTUAL 2017 TOTAL NORTH CAROLINA RETAIL SALES AND YEAR-END NUMBER OF ACCOUNTS, BY CUSTOMER CLASS:**

	2017
NC Retail MWh Sales by Duke Energy Progress	36,829,899
NC Retail MWh Sales by Wholesale	113,174
Total MWh Sales	36,943,073

Account Type	Duke Energy Progress Year-end number of Retail Accounts	Wholesale Year-end number of Retail Accounts	Total Year-end number of Retail Accounts
Residential	1,204,664	6,593	1,211,257
General	196,549	626	197,175
Industrial	1,866	8	1,874

**III. AVOIDED COST RATES**

The avoided cost rates below, applicable to energy received pursuant to power purchase agreements, represent the annualized avoided cost rates in Schedule CSP/PP (NC), Distribution Interconnection, approved in the 2016 avoided cost proceeding Docket E-100, Sub 148, the 2014 avoided cost proceeding Docket No. E-100, Sub 140; the 2012 avoided cost proceeding Docket No. E-100, Sub 136; the 2010 avoided cost proceeding Docket No. E-100, Sub 127; the 2008 avoided cost proceeding Docket No. E-100, Sub 117; and the 2006 avoided cost proceeding Docket No. E-100, Sub 106.

ANNUALIZED CAPACITY AND ENERGY RATES						
(CENTS PER KWH)						
Docket No.:	E-100 Sub 148	E-100, Sub 140	E-100, Sub 136	E-100, Sub 127	E-100, Sub 117	E-100, Sub 106
Variable Rate	3.35	4.29	4.76	5.79	5.69	4.54
5 Year	n/a	4.42	4.97	6.18	5.82	4.67
10 Year	3.79	5.08	5.47	6.82	6.05	4.85
15 Year	n/a	5.53	5.88	7.29	6.11	4.98

#### IV. ACTUAL TOTAL AND INCREMENTAL COSTS INCURRED IN 2017

Actual costs incurred in 2017 for REPS compliance were comprised of the following cost of energy purchases and the purchase of various types of RECs and other reasonable and prudent costs incurred to meet the requirements of the statute.

2017 Actual Costs Incurred	Energy and REC Costs	Other	Total Costs
<b>Total costs incurred</b>	\$261,272,833	\$1,185,415	\$262,458,248
<b>Avoided costs</b>	\$222,329,270		\$22,329,270
<b>Incremental costs</b>	\$38,943,563	\$1,185,415	\$40,128,978

#### V. ACTUAL INCREMENTAL COSTS COMPARISON TO THE ANNUAL COST CAP AS OF THE PREVIOUS CALENDAR YEAR

Account Type	Total 2016 Year-end number of Retail Accounts <sup>2</sup>	Annual Per-Account Cost Cap	Total Annual Cost Cap
<b>Residential</b>	1,183,723	\$27	\$31,960,521
<b>General</b>	191,957	\$150	\$28,793,550
<b>Industrial</b>	1,979	\$1,000	\$1,979,000
	Total Annual Cost Cap		\$62,733,071
	Actual Incremental Costs		\$40,128,978

#### VI. STATUS OF COMPLIANCE WITH REPS REQUIREMENTS

Pursuant to N.C. Gen. Stat. § 62-133.8(b) for Duke Energy Progress Retail and N.C. Gen. Stat. § 62-133.8(c) for the Company's Wholesale REPS customers, the REPS requirement for calendar year 2017 is set at 6% of 2016 North Carolina retail sales. In order to comply with the combined REPS obligation for Duke Energy Progress Retail and its Wholesale REPS customers, the Company submitted 2,210,451 RECs, which included 16,358 Senate Bill 886 ("SB886") RECs, each of which counts for two poultry waste RECs and one general REC. Accordingly, the Company submitted the equivalent of 2,243,167 RECs for compliance, representing 6% of combined 2016 retail megawatt-hour sales of 37,386,080.

<sup>2</sup> Includes number of NC retail accounts for Duke Energy Progress and its Wholesale REPS customers.

Pursuant to N.C. Gen. Stat. § 62-133.8(d), the REPS requirement for calendar year 2017 is at least 0.14% of the total electric power in kilowatt hours sold to retail electric customers in the prior calendar year in the State, or an equivalent amount of energy, shall be supplied by a combination of new solar electric facilities and new metered solar thermal energy facilities. As a result, 52,344 solar RECs were used to meet the Solar Set-Aside Requirement.

In its October 16, 2017 *Order Modifying the Swine and Poultry Waste Set-Aside Requirements and Providing Other Relief* (“2017 Delay Order”) in Docket No. E-100, Sub 113, the Commission further delayed for one year the Swine Waste Set-Aside Requirement, which will now commence in compliance year 2018. In addition, the 2017 Delay Order lowered the 2017 Poultry Waste Set-Aside Requirement to 170,000 MWh state-wide, maintaining the same level as the 2016 requirement, and delayed the subsequent increases by one year.

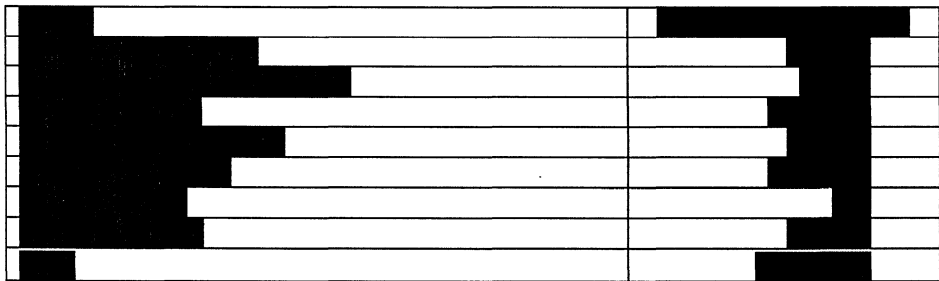

In its August 5, 2016 *Order Establishing 2016, 2017, and 2018 Poultry Waste Set-Aside Requirement Allocation* in Docket No. E-100, Sub 113, the Commission directed the annual aggregate Poultry Waste Set-Aside Requirement to be allocated among electric power suppliers and utility compliance aggregators based on the load ratio share calculations shown on the spreadsheet filed by the NC-RETS Administrator in the same docket on July 11, 2016.

In order to comply with the combined Poultry Waste Set-Aside Requirement allocated to Duke Energy Progress Retail and its Wholesale REPS customers, the Company submitted 15,358 poultry waste RECs along with 16,358 SB886 RECs, which count as 32,716 Poultry Waste Set-Aside RECs. Accordingly, the Company submitted the equivalent of 48,074 poultry RECs for compliance, and met its Poultry Waste Set-Aside Requirement.

**VII. IDENTIFICATION OF RECs CARRIED FORWARD**

The table below reflects the RECs at year-end 2017 that the Company has banked for use in future compliance years.

[BEGIN CONFIDENTIAL]

A table with approximately 12 columns and 8 rows. The content is almost entirely redacted with black bars, leaving only a few white rectangular shapes visible within the cells.A large rectangular area that is completely redacted with a solid black fill.

[END CONFIDENTIAL]

**VIII. DATES AND AMOUNTS OF ALL PAYMENTS MADE FOR RENEWABLE ENERGY CERTIFICATES**

Confidential Appendix 1 illustrates the dates and amounts of all payments made for renewable energy certificates during calendar year 2017.

**(C) METHODOLOGY FOR DETERMINING NUMBER OF CUSTOMERS AND CUSTOMER CAP**

Consistent with the Commission’s order issued November 12, 2009 in Docket No. E-2, Sub 948, for purposes of REPS billing, the Company defines as a single customer all accounts (metered and unmetered) serving the same customer of the same revenue classification located on the same or contiguous properties. If a customer has accounts which serve in an auxiliary role to a main account on the same premises, no REPS charge applies to the auxiliary accounts, regardless of their revenue classification.

Within the Wholesale group, the Town of Black Creek, the Town of Lucama, the Town of Sharpsburg, the Town of Stantonburg, and the Town of Winterville each determine the number of accounts for purposes of REPS compliance in the manner such information is reported to the Energy Information Administration for annual electric sales and revenue reporting.

Respectfully submitted this the 20<sup>th</sup> day of June, 2018.

## CAPER PVSG Project Progress Report

PI: Alex Huang

Dec 13, 2017

Dr. Huang's team has previously developed a single phase PVSG, this work has been accomplished and one paper was published. See paper in "Integration of DC Microgrids as Virtual Synchronous Machines Into the AC Grid," in *IEEE Transactions on Industrial Electronics*, vol. 64, no. 9, pp. 7455-7466, Sept. 2017. The CAPER project focus is on development and demonstration of a 40 KW three PVSG system. In particularly, the architecture is changed so that the concept can work with existing PV installations. So far, the following major accomplishments have been made:

1. Hardware architecture defined and major components/subsystem in place
2. New control architecture proposed and simulated. A typical simulation result is shown in Figure 1.
3. PVSG controller hardware design finished and manufacturing is underway
4. System rack in place and ready for hardware integration

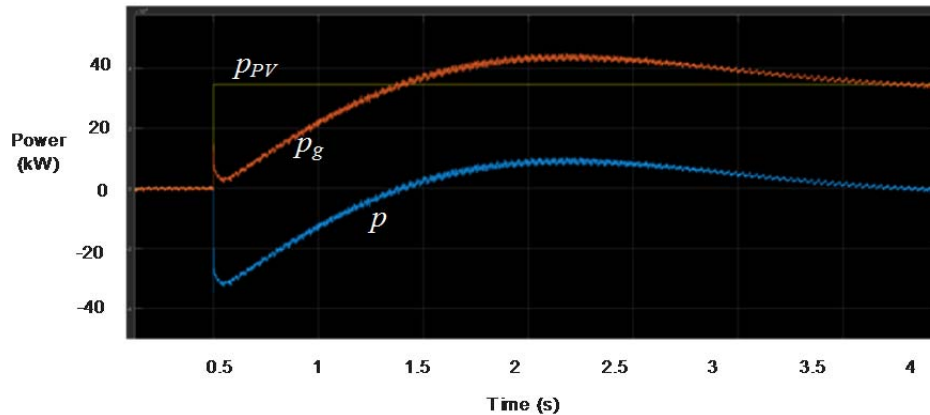

Figure 1 Virtual inertia simulation when there is a sudden increase in irradiation level

Table below shows a summary of remaining work. The remaining work are

- 1) Manufacturing and testing of a new digital controller needed for the PVSG
- 2) Software coding of the control system
- 3) Hardware integration and testing
- 4) Summary, report and publication.

**How State Regulators are Attributing Costs and Benefits to Distributed Generation**

**Phase I: A Review of Distributed Generation Valuation Studies and Methodologies**

Mesut Baran, Autumn Proudlove, Badrul Chowdhury,  
Keith Dsouza, Sumedh Halbe, Micah Thomas

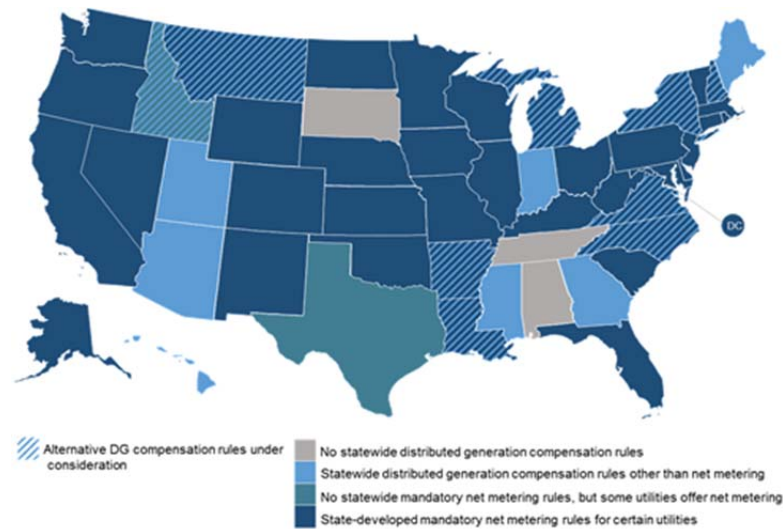

**Abstract**

The first phase of the project aims to review recently conducted studies on the value of distributed generation. This report provides the findings of this phase of the project. A number of widely available reports on distributed generation valuation are reviewed to determine the methods used to quantify the cost/benefit components across eleven components. Core categories included in almost every study were avoided energy, avoided generation capacity, avoided transmission and distribution capacity, and system/line losses. Most studies also included solar integration costs and at least some environmental benefits. However, it is noted that each study utilizes different assumptions and methods in calculating these components. A summary of the methodologies adopted in these studies for each component is provided.

**Introduction**

As more distributed solar is being added to the electric grid, states and utilities are reevaluating the way in which customer-generators are compensated. In the vast majority of U.S. states (as Figure 1 shows) these customers have been compensated through a mechanism called net metering. Under net metering, a customer's total kilowatt-hour (kWh) energy production and consumption over the billing period are netted. States differ in their policies for compensating monthly net excess generation; some states allow these credits to roll over month-to-month at the full retail rate, while others may credit this net excess at the avoided cost rate or reduce the credit after a certain period of time.

**Figure 1: Net Metering and DG Compensation Policies (Oct. 2017)**

Source: NC Clean Energy Technology Center, 50 States of Solar Q3 2017, October 2017

While net metering has been the dominant compensation structure for distributed solar for many years, a growing number of states are examining alternatives to net metering, including net billing and buy-all, sell-all structures. At the heart of these net metering successor discussions is how the credit rate for excess generation should be calculated. One method, which many different stakeholders have expressed a desire for, is a value-based credit. This interest in value-based compensation has led many states, utilities, and other stakeholders to conduct studies examining the value of solar or distributed generation in efforts to inform net metering successor discussions (see Figure 2). However, these studies utilize many different methodologies and result in a wide range of ultimate values.

The first phase of this project aims to review recently conducted studies on value of distributed generation. The results of this review have been outlined below.

**Figure 2: State-Led DG Valuation Action (2015 – 2017)**

### Existing Studies

One of the project partners, the NC Clean Energy Technology Center (NCCETC), has been compiling studies commissioned by either state regulatory bodies or utilities on value of distributed generation as part of its *50 States of Solar* quarterly report series. This database was first scanned to identify a short list of studies to be further reviewed for this project. Table 1 shows the full list of studies considered, as well as the cost/benefit components considered within each study. A list of studies is also provided in Appendix I.

Many states, utilities, advocacy organizations, and others have conducted these studies in order to examine the value of distributed generation, or solar specifically. The results of these studies vary dramatically, as Figure 3 shows.

There are multiple reasons for this variation. The first is due to the utility’s generation mix and infrastructure. As avoided energy and capacity costs are typically tied to the marginal generation unit, the particular unit that is on the margin will greatly impact the ultimate value. Furthermore, the utility’s existing transmission and distribution network will affect the value of transmission and distribution expenditures avoided by distributed solar.

**Table 1: Cost and Benefit Components Included in Recent Studies**

Year	Study	Costs		Benefits										
		Integration Cost	Admin. Cost	Avoided Energy	Avoided Gen. Capacity	Avoided Transmission	Avoided Distribution	System/Line Losses	Ancillary Services	Risk/Price Hedging	Market Price Suppression	Env. Benefits	Other	
2006	Austin Energy (CPR)													
2009	Arizona Public Service (R.W. Beck)													
2012	Michigan (NREL)													
2012	New Jersey/Pennsylvania (CPR)													
2013	CPS Energy													
2013	Arizona Public Service (SAIC)													
2013	Xcel Energy – CO (CPR)													
2013	Arizona Public Service (Crossborder)													
2013	North Carolina (Crossborder)													
2013	Austin Energy (CPR)													
2014	Utah (CPR)													
2014	Xcel Energy – MN (CPR)													
2014	Nevada (E3)													
2014	Mississippi (Synapse)													
2014	Vermont (Public Service Dept.)													
2015	Maine (CPR)													
2015	Massachusetts (Acadia Center)													
2015	Louisiana (Acadian Consulting)													
2015	Tennessee Valley Authority (EPRI)													
2015	South Carolina (E3)													
2016	Arizona Public Service (Crossborder)													
2016	Nevada (SolarCity)													
2016	Nevada (E3)													
2017	Georgia Power (Georgia Power)													
2017	District of Columbia (Synapse)													
2017	Oregon (PUC)													
2017	Entergy Arkansas (Crossborder)													

Variation across studies also results from the difference in solar penetration from location to location. Jurisdictions with high levels of distributed solar on the system may see diminished benefits from additional solar capacity, while jurisdictions with very little distributed solar are more likely to realize larger benefits, at least initially.

**Figure 3: Value of DG Study Results**

Finally, a significant reason for variation across studies is due to the different set of cost and benefit components included within each study. While some studies are narrower in focus, only including avoided energy and generation capacity for example, others are more expansive, including ancillary services and environmental benefits. Furthermore, for each cost or benefit component, there exists a variety of methodologies to calculate its quantitative value.

### **Cost-Benefit Methodologies**

The first study reviewed was a meta-study conducted by the Rocky Mountain Institute (RMI) in 2013 [1]. This study provides a broad summary of the 16 benefit/cost studies for Distributed PV (DPV) systems conducted by utilities, national laboratories, and other organizations between 2005 and 2013. The study lists the following cost/benefit categories/components:

- Category 1: Energy: This includes avoided energy and avoided system losses.
- Category 2: Capacity: This includes avoided generation capacity, T&D Capacity, and DPV installed capacity.
- Category 3: Grid support services: also known as ancillary services and includes operating reserves, voltage control, and frequency regulation.
- Category 4: Financial Risk: Estimates the potential for DPV to provide a “hedge” against price volatility, and thus reducing risk exposure to utilities and customers.
- Category 5: Security Risk: Potential of DPV to reduce outages and also potential for customers to have back-up power capability.
- Category 6: Environmental: Potential to reducing carbon emissions.

- Category 7: Social: Social value of DPV based on its contribution to economic growth.

The report indicates that there is significant deviation about how these components are quantified. A more detailed summary of this report is provided in Appendix II.

The project team then selected five more recent DG valuation studies for a more in-depth review. These studies were selected to represent examples of studies conducted in other southeastern states, studies with varying cost and benefit components included, and studies conducted by different authors (frequently, outside consultants will be hired to conduct the study analysis, and many existing studies utilize the same consultancies). The studies reviewed are shown below.

Study	Description
<b>Georgia Power</b> [2] (2016, authored by utility)	This study was conducted as part of the utility’s integrated resource planning process. The study considers technology and supporting infrastructure as they exist presently. The purpose of the report is to define an impact related to distributed energy resources as a cost and/or benefit and to quantify the same.
<b>Minnesota</b> [3] (2014, authored by consultant on behalf of state govt.)	This study was conducted by Clean Power Research on behalf of the Minnesota Department of Commerce. The state developed a methodology to calculate the value solar with an eventual aim to replace the existing net metering policy with a value of solar rate structure. If known and measurable evidence of other costs and/or benefits existed, then it was decided to incorporate them into the methodology.
<b>Mississippi</b> [4] (2014, authored by consultant on behalf of state govt.)	This study was conducted by Synapse Energy Economics on behalf of the Mississippi Public Service Commission as part of an investigation into the creation of net metering rules for the state.
<b>Tennessee Valley Authority</b> [5] (2015, authored by EPRI/stakeholder group)	This study was led by the EPRI, with a stakeholder group developing the cost-benefit categories. The purpose of the study was to select cost/benefit categories and develop a firm analytical basis for calculating each of these categories. The study was limited to rooftop solar and aimed to create a transparent, fair, adaptable, and versatile methodology. The final calculation did not include societal values that were identified and set aside for potential future inclusion.
<b>Vermont</b> [6] (2014, authored by state govt.)	This study was conducted by the Vermont Public Service Department. Act 99, enacted in 2014, direct the Department to conduct an evaluation of net metering in the state.

Each of these studies has been reviewed in detail to determine the methods used to quantify the cost/benefit components the study considered. Table I shows the main components considered in these studies. Below is a summary of the methodologies adopted in these studies for each component. A more detailed summary for each study reviewed is provided in Appendix III.

*Cost 1: Solar Integration Costs*

The majority of studies include the costs associated with integrating distributed solar in their cost-benefit calculations. The table below summarizes the methods used by the five studies examined.

Study	Methodology
Georgia Power	Distribution operating costs is given a placeholder value, as the utility has not developed a methodology to calculate the expected costs associated with significant penetration of renewable resources. A point was made that interconnection costs are directly assignable to the generator at the time of implementation, and should therefore not be included in the methodology.
Minnesota	Included in the cost-benefit stack, but a methodology has not yet been developed.
Mississippi	Solar integration costs were ignored. Synapse concluded that grid integration costs increase as penetration level increases. They found very little evidence that significant costs are incurred by grid operators or distribution companies since penetration levels are low in Mississippi.
Tennessee Valley Authority	Not included in study, although the authors noted that the transmission capacity value may be revised to include integration costs.
Vermont	Notably, as the location out of the five examined with the most net-metered capacity, this component is not included in the study.

*Cost 2: Administrative Costs*

A smaller number of studies include administrative costs associated with distributed solar (such as administering a net metering program) in their calculations. The table below summarizes the methods used by the three studies addressing administrative costs.

Study	Methodology
Georgia Power	A placeholder value is provided in the report, but a methodology has not been determined.
Mississippi	The authors collected cost data for energy efficiency programs from many states. The authors estimated that an average utility spends between 6-9% of energy efficiency program expenses on administrative costs (average is 7.5%). Energy efficiency programs in Mississippi cost approximately \$12 million, and 7.5% of \$12 million is \$0.9 million.
Vermont	Administrative costs are assumed to be the same values as reported in "Evaluation of Net Metering in Vermont Conducted Pursuant to Act 125 of 2012," which include two types of costs: procedural and billing.

*Benefit 1: Avoided Energy*

Solar PV generation avoids the need for a certain amount of energy from the marginal generators (typically natural gas). Avoided energy values often factor in fuel price forecasts, power plant efficiencies, and variable operating and maintenance (O&M) costs. The table below summarizes the methods used by the five studies examined.

Study	Methodology
Georgia Power	Calculated as the weighted average of the energy produced by solar PV per hour and the system avoided cost of energy for that period. This value depends on the resource displaced, its incremental heat rate, variable O&M, fuel handling costs, and losses.
Minnesota	A virtual solar heat rate is computed based on the heat rate vs energy production of each generator. This weighted heat rate is then multiplied by the burnertip fuel unit price to give the value of avoided fuel costs.
Mississippi	Avoided energy costs are estimated by multiplying the variable operating and fuel costs of the marginal resource by the projected MWh of solar generation modeled in each year.
Tennessee Valley Authority	The Resource Planning Process is run with and without PV using an hourly time-step. The value depends upon the avoided resource and the fuel price.
Vermont	Avoided energy was calculated on an hourly basis by multiplying the production of real Vermont generators by the hourly price set in the ISO-NE market. These calculations indicated that fixed solar PV had a weighted average avoided energy price 9% lower than the annual ISO-NE average spot market price.

*Benefit 2: Avoided Generation Capacity*

Distributed generation may defer or obviate the need for new investments in generation capacity. In most locations, natural gas combustion turbines are the marginal units, and avoided generation capacity value is based on the cost of these units. The table below summarizes the methods used by the five studies examined.

Study	Methodology
Georgia Power	<p>Calculated as the product of capacity value and capacity equivalence. Capacity equivalence is similar to Effective Load Carrying Capacity (ELCC), wherein only some fraction of the installed solar PV is considered to reduce capacity needs from the grid.</p> <p>Also includes Generation Remix Costs (GRC), which are identified as being either a cost or a benefit. GRC includes two components, (1) the capital cost and (2) the production cost. The GRC formula can be found in Appendix III.</p>

	Support capacity costs are calculated as the difference between the capital (or production) cost in the base case and the capital (or production) cost with PV in the system (generation remix case).
Minnesota	The solar-weighted capacity cost is based on the installed capital cost of a peaking combustion turbine and the installed capital cost of a combined cycle gas turbine, interpolated based on heat rate.
Mississippi	The authors calculated the amount of installed solar capacity every year (assumed 88 MW for analysis) and calculated the number of MW that contribute to reduction in peak load by using an Effective Load Carrying Capability (ELCC) of 58%. Thus, capacity contribution will be 58% of 88MW, which is 51 MW. The authors multiplied this capacity contribution by the capacity value in each year and divided this by total solar generation in that year to yield a \$/MWh value.
Tennessee Valley Authority	The Resource Planning Process is run with and without PV for a period of 20 years. A multiplier - Net Dependable Capacity (NDC) - is used for capacity-related benefits and reflects the proportion of PV capacity that offsets conventional generation capacity. The system peak and the related solar output at that time are compared to calculate NDC. A 50% NDC is used to calculate avoided generation capacity.
Vermont	The study examined the timing of relevant peaks: ISO-NE's peak for capacity costs, Vermont summer peaks for in-state transmission costs, monthly Vermont peaks for Regional Network Service (RNS) costs and utility specific peak hours for distribution costs. The ability of variable generators to help avoid ISO-NE capacity costs depends on the level of generation during summer hours when ISO-NE's system demand peaks.

*Benefit 3: Avoided Transmission and Distribution Capacity*

Distributed generation may relieve congestion on the transmission and distribution (T&D) system, deferring or obviating the need for new investments. More granular analyses may develop locational values for avoided T&D. The table below summarizes the methods used by the five studies examined.

Study	Methodology
Georgia Power	A single transmission line outage contingency analysis is performed. The analysis is performed with and without PV to study the impact (and cost or benefit) of PV on the grid. Georgia Power only includes avoided transmission, and does not include avoided distribution investment in its analysis.
Minnesota	Calculated in a similar way as avoided generation capacity. No degradation in capacity is considered. It is based on the utility's 5-year average MISO OATT Schedule 9 charge in start year U.S. dollars.
Mississippi	Authors used their in-house database to calculate avoided T&D costs calculated for DG and energy efficiency programs to provide a rough estimate.
Tennessee Valley	The costs and benefits are evaluated by considering the system peak, NDC, PV profile, and avoided costs; a simplified calculation with the point to point service rate and monthly peak factors was

Authority	ultimately used.
Vermont	<p><u>Avoided Regional Transmission Costs</u>: The values quantified for these costs are based on the ISO-NE forecast for the next three years' worth of Regional Network Service charges and escalated based on historical increases in the handy-Whitman Index of public utility construction costs.</p> <p><u>Avoided In-State Transmission and Distribution Costs</u>: Burlington Electric Department forecasts show that there are no load growth related infrastructure investments planned for next 20 years, hence these costs have been excluded. In-state transmission and distribution upgrades deferred due to load reduction are calculated considering the critical value of how much generation the grid can rely on during peak times. Reliability peak coincidence values were calculated separately from economic peak coincidence values.</p>

*Benefit 4: Avoided System and Line Losses*

As distributed generation is located nearer to end-use consumers, it may reduce system and line losses associated with transmitting power from centralized generators long distances to reach end users. System losses are sometimes included within avoided energy and avoided T&D capacity. The table below summarizes the methods used by the five studies examined.

Study	Methodology
Georgia Power	<p>As the load is reduced or displaced in the model by DG, the impact of the load reduction and related transmission system losses is inherently included in the analysis of any change in timing of transmission investment. The demand component is recognized as a benefit that is already included in the avoided transmission capacity value.</p> <p>The reduced distribution energy loss is calculated by applying an 8760-hour distribution loss profile to the system avoided energy costs. The benefit of the reduced distribution energy losses is incorporated into the avoided energy cost calculation.</p>
Minnesota	Calculated on a marginal basis as the difference in losses between the cases with and without marginal PV resource. A loss saving factor is calculated, based on the avoided energy with and without losses.
Mississippi	Synapse estimates avoided system losses using a weighted average line loss during each daylight hour. Calculated by weighing daylight line losses of each T&D system in proportion to the load each system serves. Avoided system losses were calculated as the product of weighted average system losses and projected generation from solar in each year times the avoided energy cost in the same year.
Tennessee Valley Authority	All components except environmental market value are multiplied by an average loss savings value. A 1 MW AC solar PV case was used to model average marginal loss savings.
Vermont	Included as part of the methodologies for avoided energy and avoided generation capacity.

*Benefit 5: Ancillary Services*

Solar PV can sometimes reduce the need for certain ancillary services, including operating reserves, reactive supply, voltage control, frequency regulation, energy imbalance, and scheduling. Some studies may quantify the value of multiple ancillary services or only one. The table below summarizes the methods used by the three studies addressing ancillary services.

Study	Methodology
Georgia Power	Includes ancillary services (reactive supply, voltage control, and regulation) as a cost, rather than a benefit. The regulating reserve requirement is calculated and consists of two components: (1) regulating reserve reliability impact and (2) forecast error reliability impact.
Minnesota	Avoided voltage control cost is included in the cost-benefit stack, but a methodology has not yet been determined.
Tennessee Valley Authority	Ancillary services value was acknowledged, but not included in calculation. Authors determined that further study and data is needed.

*Benefit 6: Price Hedging and Risk Reduction*

Solar PV offers price certainty, while the cost of energy from fossil fuel fired generators depends upon variable fuel prices. Price hedging value is typically based on the price of natural gas futures and estimates of future natural gas costs. The table below summarizes the methods used by the three studies addressing price hedging.

Study	Methodology
Georgia Power	Georgia Power addressed fuel hedging in its study, but recommended not including this in the cost-benefit framework, stating that it does not believe renewable resources provide this benefit.
Minnesota	The avoided fuel cost value includes the avoided cost of price volatility risk.
Mississippi	The risk reduction benefit estimation was calculated by applying an adder (adjustment factor) to the avoided costs rather than attempting a technical analysis. Current optimal practice supports a 10% adder to avoided costs of renewables like solar.

*Benefit 7: Market Price Suppression*

Solar PV can suppress wholesale market prices by reducing customer demand for energy or by being directly bid into wholesale markets (either larger PV facilities or smaller aggregated facilities). This can cause the marginal generator to be a lower-cost unit, reducing electricity costs for all customers. The table below summarizes the methods used by the two studies addressing market price suppression.

Study	Methodology
Minnesota	Market price reduction is addressed in the study, but was not included in the final value of solar methodology.
Vermont	Approximated this using the analysis based on the 2013 Avoided Energy supply cost study calculations of the demand reduction induced price effect for Vermont.

*Benefit 8: Environmental Compliance and Benefits*

Many DG valuation studies include a value for environmental benefits or reduced environmental compliance costs. These values include reduced carbon emissions, criteria air pollutants, water use, land use, as well as avoided or costs of complying with renewable portfolio standard policies and other clean energy or environmental regulations.<sup>1</sup> Table below summarizes the methods used.

Study	Methodology
Georgia Power	Avoided cost of complying with existing environmental regulations is included as part of avoided energy costs. Other environmental benefits and compliance with potential future regulations are not included.
Minnesota	Environmental costs are based on existing Minnesota and EPA externality costs. CO <sub>2</sub> and non-CO <sub>2</sub> natural gas emissions factors (lb per MM BTU of natural gas) are taken from the EPA. The costs are adjusted for inflation (converted to current dollars), converted to dollars per short ton, and then converted to cost per unit fuel consumption using the assumed values. The externality costs are taken as the midpoint of the low and high values for the urban scenario, adjusted to current dollars, and converted to a fuel-based value.
Mississippi	The analysis uses the mid case of the authors' avoided environmental compliance estimation. It is forecasted that a carbon price begins in 2020 at \$15 per ton and increases to \$60 per ton in 2040.
Tennessee Valley Authority	<u>Compliance Value:</u> Environmental compliance value is based on the carbon intensity of the generation assets deferred. A CO <sub>2</sub> compliance cost curve beginning in 2022 is assumed.  <u>Market Value:</u> This is the value of a renewable energy credit (REC). A \$1/MWh value (based on national voluntary REC market prices) is applied with a 1.9% escalation rate, consistent with TVA's integrated resource planning process.  A placeholder for other environmental benefits is also included.
Vermont	<u>Renewable Energy Credit Value:</u> A fixed value of \$30/MWh is assumed for potential future regulatory value of REC retirement. (At the time of this study, Vermont did not have a mandatory renewable portfolio standard (RPS). In 2015, the Vermont legislature adopted a binding RPS of 75% by 2032.)  <u>Environmental Compliance Value:</u> Analysis was done for non-participating ratepayers both with

<sup>1</sup> Rocky Mountain Institute, A Review of Solar PV Benefit and Cost Studies, September 2013.

	and without an externalized cost of greenhouse gas emissions. The authors assumed a value of \$100/metric ton of CO <sub>2</sub> .
--	--

*Benefit 9: Other Benefits*

A handful of studies included other societal benefits, such as local economic development (3 studies examined) and enhanced security (2 studies examined). Several studies acknowledged these additional benefits, but did not attempt to quantify them.

**Sensitivity Analysis**

Many DG valuation studies include various sensitivity analyses in order to display the range of values produced by adjusting assumptions and methods. For example, several studies calculate one value based on the “direct” benefits of solar, and a separate value including societal benefits. Other studies vary the time horizon over which the analysis is conducted, assumptions about future fuel prices, or the amount of installed solar capacity.

Study	Sensitivity Analyses
Georgia Power	No sensitivity analyses were conducted.
Minnesota	No sensitivity analyses were conducted, likely because a state methodology had been adopted.
Mississippi	Sensitivity analyses are conducted for low, mid and high fuel price scenarios and capacity value scenarios. Synapse utilized the 25 <sup>th</sup> and 75 <sup>th</sup> percentiles of its T&D cost database to produce T&D cost sensitivities. Low, mid, and high cases were also examined for CO <sub>2</sub> prices. Two combined sensitivities were also modeled, which included the assumptions that would produce the lowest and highest benefits for solar.
Tennessee Valley Authority	Illustrative values are provided for several of the placeholder categories that are not included in the DG-IV methodology, although no formal sensitivity analysis was conducted.
Vermont	The costs and benefits for six different types of solar and wind systems are calculated, although no sensitivity analyses for these systems are conducted.

Of the five studies examined, the Mississippi study is the only study including formal sensitivity analyses. Low, mid, and high cases are modeled for fuel prices, capacity value, T&D costs, and CO<sub>2</sub> price, as well as two combined sensitivities that reflect the assumptions yielding the lowest and highest benefits to solar.

**Conclusion**

Existing studies examining the value of DER display great variation in cost-benefit categories and methodologies, producing a large spread in results. Core categories included in nearly every study the

team examined were avoided energy, avoided generation capacity, avoided transmission and distribution capacity, and system/line losses. Most studies also included solar integration costs and at least some environmental benefits. Despite these commonalities, each study utilizes different assumptions and methods in calculating these components.

Several studies utilized a stakeholder or state-led process to develop the categories to be included in the study, as this can greatly influence the final results. Some states, such as Oregon and Rhode Island, have developed official cost-benefit frameworks through stakeholder processes before attaching any quantitative values to categories. Studies conducted by singular, non-government parties (solar advocacy organizations, utilities, etc.) are not to be discredited, but should be read with funder and author in mind.

Many studies include various sensitivity analyses to display multiple possibilities, varying both technical assumptions as well as which cost-benefit components are included (several studies produce results with and without a broader set of societal benefits). This approach makes available a large amount of data, helping to answer the question of whether DG provides each benefit, while leaving the question of whether DG should be compensated for each benefit to policymakers, utilities, and advocates.

Phase II of this project will evaluate the various methodologies utilized in existing DG valuation studies to develop a methodology for use in a North Carolina case study.

## **Appendix II: Summary of Rocky Mountain Institute Report: A Review of Solar PV Benefit and Cost Studies (2013)**

The aim of this report was to compare various methodologies for evaluating different value streams of distributed solar photovoltaics (DPV). The report is based on a review of 16 DPV benefit-cost studies completed by utilities, national laboratories, and other organizations between 2005 and 2013.

The report points out the framework developed in the California Standard Practice Manual, which establishes the general standard for evaluating the costs and benefits of energy efficiency among stakeholders was adopted. This framework describes the followings costs:

1. **Participant Cost:** Cost that is incurred by the participants in order to generate energy through DERs. (Equipment and installation costs, etc.)
2. **Rate Impact:** The change in rates for non-participating customers due to cost shifting/cross subsidization that occurs as a result of DERs on the grid.
3. **Utility Cost:** The cost that the utility incurs to support the smooth function of DERs on the grid, while maintaining reliability and quality of service.
4. **Total Resource Cost:** The total cost of operating and supporting DERs on the grid. This includes the costs borne by participants, other customers, and the utility.
5. **Societal and Environmental Cost:** The cost avoided in the form of environmental compliance, regulation etc., as well as, the additional revenue generated from economic activities related to DER.

As illustrated in Figure A1, the report identifies the following benefit & cost categories:

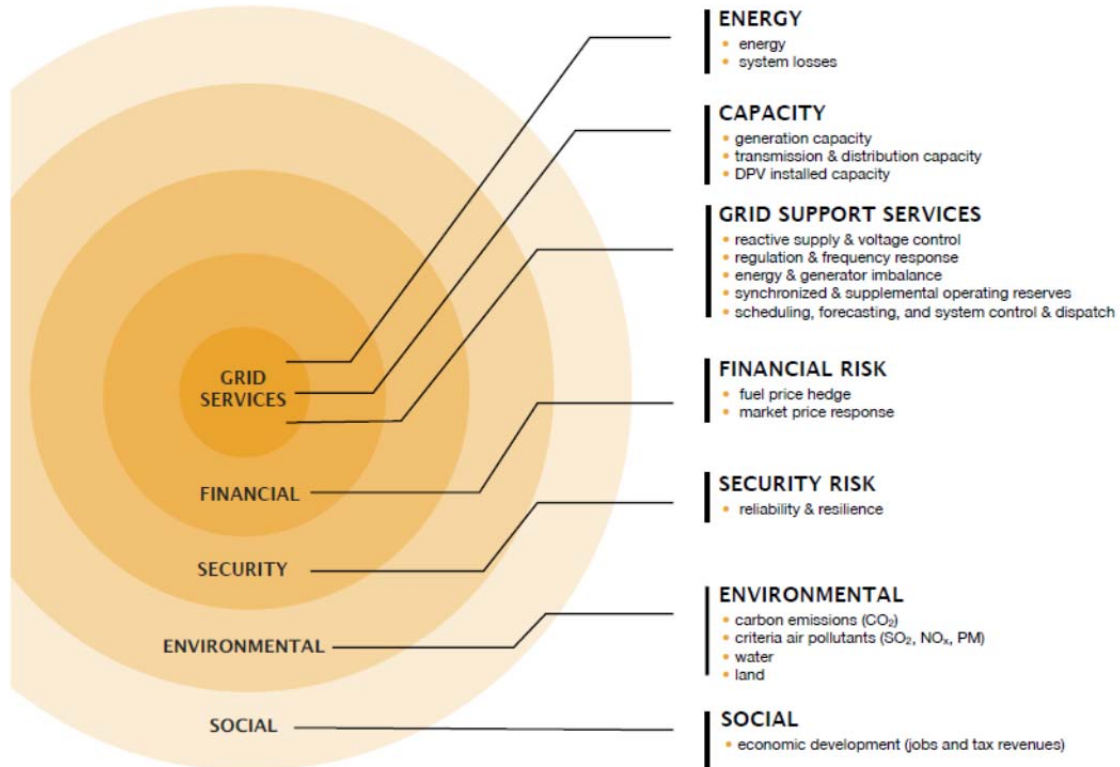

1. **Energy** value is created when DPV generates energy (kWh) that displaces the need to produce energy from another resource. There are two components of energy value: the amount of energy that would have been generated equal to the DPV generation, and the additional energy that would have been generated, but is lost in delivery due to inherent inefficiencies in the transmission and distribution system. The second component is system losses.
  - This value will depend on the resource on the margin at each time interval
  - Depends on the market structure, fuel price, plant efficiency, and Variable O&M costs
2. **Capacity**
  - 2.1: Generation Capacity** value is the amount of central generation capacity that can be deferred or avoided due to the installation of DPV. Key drivers of this value include: (1) DPV's effective capacity and (2) system capacity needs. Deferred value depends on the effective load carrying capacity (ELCC), which depends on the system peak and the capacity of DPV during the same period.
  - 2.2 Transmission and Distribution (T&D) Capacity** value is a measure of the net change in T&D infrastructure as a result of the addition of DPV. Benefits occur when DPV is able to meet rising demand locally, relieving capacity constraints upstream and deferring or avoiding T&D upgrades. Costs are incurred when additional T&D investments are necessary to support the

addition of DPV, which could occur when the amount of solar energy exceeds the demand in the local area and increases needed line capacity. This value depends on ELCC/peak load reduction.

## BENEFIT & COST CATEGORIES

For the purposes of this report, value is defined as net value, i.e. benefits minus costs. Depending upon the size of the benefit and the size of the cost, value can be positive or negative. A variety of categories of benefits or costs of DPV have been considered or acknowledged in evaluating the value of DPV. Broadly, these categories are:

*A Review of Solar PV Benefit & Cost Studies, 2nd edition*

**Figure A1: RMI Benefit and Cost Categories**

3. **Grid Support Services**, also commonly referred to as ancillary services in wholesale energy markets, are required to enable the reliable operation of interconnected electric grid systems. These services include operating reserves; reactive supply and voltage control; frequency regulation; energy imbalance; and scheduling. The value DPV could provide comes by reducing load and required reserves or the ancillary services that DPV could provide when coupled with other technologies. This value depends on market structure and the type of services that DPV can provide.
4. **Financial Risk:** DPV produces roughly constant-cost power compared to fossil fuel generation, which is tied to potentially volatile fuel prices. DPV can provide a “hedge” against price volatility, reducing risk exposure to utilities and customers. The addition of DPV, especially at higher penetrations, can affect the market price of electricity in a particular market or service territory. These market price effects span energy and capacity values in the short term and long term, all of which are interrelated. This value depends on resource being displaced.

5. **Security Risk:** The grid security value that DPV could provide is attributable to three primary factors, the last of which would require coupling DPV with other technologies to achieve the benefit:
  - The potential to reduce outages by reducing congestion along the T&D network. Power outages and rolling blackouts are more likely when demand is high, and the T&D system is stressed.
  - The ability to reduce large-scale outages by increasing the diversity of the electricity system's generation portfolio with smaller generators that are geographically dispersed.
  - The benefit to customers to provide back-up power sources available during outages through the combination of PV, control technologies, inverters and storage.
  
6. **Environmental:** The benefits of reducing carbon emissions and other pollutants include (1) reducing future compliance costs, carbon taxes, or other fees and (2) mitigating the health and ecosystem damages potentially caused by these pollutants, as well as climate change. The cost related to a reduction in the use of land, water, and other such resources can also be considered.
  
7. **Social:** The assumed social value from DPV is based on any job and economic growth benefits that DPV brings to the economy, including jobs and increased tax revenue. The value of economic development depends on the number of jobs created or displaced, as measured by a job multiplier, as well as the value of each job, as measured by average salary and/or tax revenue.

One of the main conclusions of the report is that there is a significant range of estimated values across studies. Figure A2 illustrates these variations. The authors point out that these variations are driven primarily by differences in local context, input assumptions, and methodological approaches:

- **Local context:** Electricity system characteristics—generation mix, demand projections, investment plans, market structures vary across utilities, states, and regions.
- **Input assumptions:** Input assumptions—natural gas price forecasts, solar power production, power plant heat rates can vary widely.
- **Methodologies:** Methodological differences that most significantly affect results include (1) resolution of analysis and granularity of data, (2) assumed cost and benefit categories and stakeholder perspectives considered, and (3) approaches to calculating individual values.

Another issue highlighted by this report is the cross subsidization that can occur between DER and non-DER customers, especially through net metering. DER customers are charged only for their net usage, which may not their fixed costs for use of the grid. In the short term, utility costs are fixed, and as a result, the reduced revenue collected from DER customers must be recovered from non-DER customers.

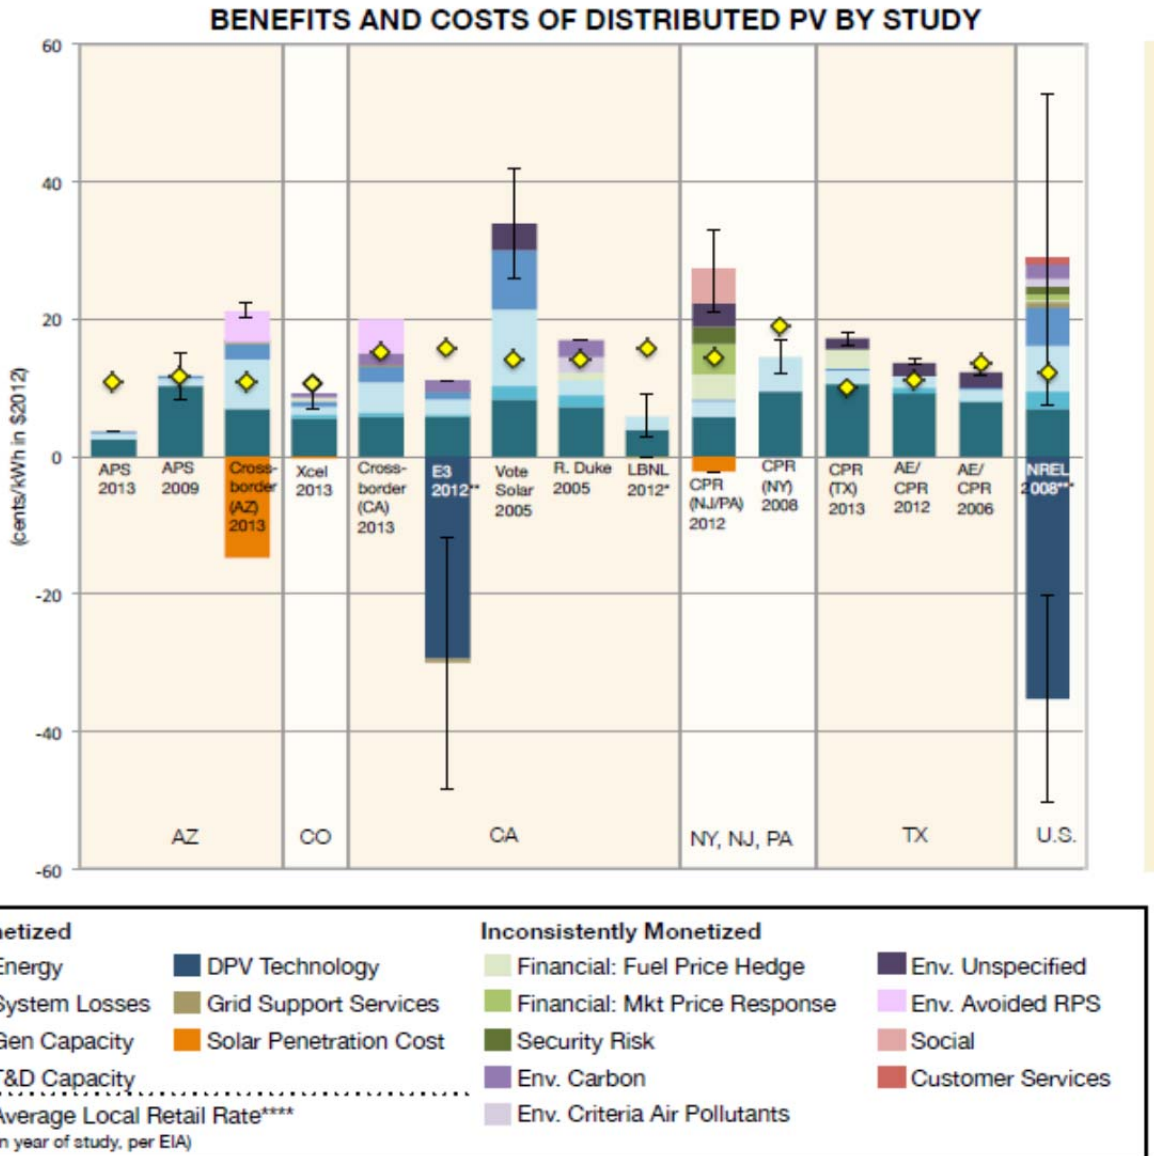

Figure A2: Variation of DPV Values in Studies Reviewed By RMI

**Appendix III.A: Summary of Study: A Framework for Determining the Costs and Benefits of Renewable Resources in Georgia (Georgia Power, 2017)**

As part of Georgia Power's 2016 Integrated Resource Planning proceeding, the utility developed a framework for determining the costs and benefits of renewable resources. The study considers technology and supporting infrastructure as they exist presently and examines both utility-scale and distributed generation. The purpose of the report is to define each impact related to renewables as a cost and/or benefit and to quantify each. The quantitative values ultimately arrived at are redacted.

The value streams identified in the report are as follows:

1. Avoided Fuel and Power cost
2. Avoided Generation VO&M Cost
3. Avoided Environmental Compliance Cost
4. Deferred Generation Capacity Cost
5. Deferred Generation FO&M Cost
6. Reduced Transmission Energy Losses
7. Reduced Transmission Capacity Losses
8. Deferred Transmission Investment
9. Reduced Distribution Energy Losses
10. Distribution Operations Cost
11. Generation Remix Cost

The report further expounded on the following items:

1. **Avoided Energy Costs:** Calculated as the weighted average of the energy produced by solar PV per hour and the system avoided cost of energy for that period. This value depends on the resource displaced, its incremental heat rate, variable O&M, fuel handling costs, and losses.
2. **Deferred Capacity Costs:** Calculated as the product of capacity value and capacity equivalence. Capacity equivalence is similar to Effective load carrying capacity (ELCC), wherein only some fraction of the installed solar PV is considered to reduce capacity needs from the grid.
3. **Deferred Transmission Investment Costs:** Calculated in a similar manner as avoided generation capacity; the planning horizon considered is 20 years. A single transmission line outage contingency analysis is performed using MUST (Managing and Utilizing System Transmission) power flow analysis tool. The analysis is performed with and without PV to study the impact (and cost or benefit) of PV on the grid. Georgia Power only includes avoided transmission, and does not include avoided distribution investment in its analysis.
4. **Reduced Transmission Losses:** The demand component of transmission losses represents the reduction in demand (MW) on the transmission system, resulting from a reduction in transmission system losses due to the renewable generation. As the load is reduced or displaced in the model by DG, the impact of the load reduction and related transmission system losses is inherently included in the analysis of any change in timing of transmission investment. The demand component is recognized as a benefit that is already included in the avoided transmission capacity value.

5. **Reduced Distribution Energy Losses:** The reduced distribution energy loss due to the addition of DG is calculated by applying an 8760-hour (8784 for leap year) distribution loss profile to the system avoided energy costs. Alternatively, the DG profile can be grossed up by the amount of distribution losses. In this case, the benefit of the reduced distribution energy losses is incorporated into the avoided energy cost calculation.
6. **Generation Remix Costs:** This has two components: capital cost and production cost.
  - a. The capital component is calculated as follows:

$$GRC = (SMC_{remix} - SMC_{base}) - DGCC$$

*GRC* = Generation Remix Capital Cost, *SMC<sub>base</sub>* = Capital cost of the future build-out of the System Mix base case, *SMC<sub>remix</sub>* = Capital cost of the future build-out of the System Mix case with the renewable resource, *DGCC* = Deferred Generation Capacity Costs associated with the renewable resource.

- b. The production cost/energy component is calculated as follows:

$$GRP = (SPC_{remix} - SPC_{base}) - AEC.$$

*GRP* = Generation Remix Production Cost, *SPC<sub>base</sub>* = System production cost of the base case, *SPC<sub>remix</sub>* = System production cost of the case with the renewable resource and modified expansion plan, and *AEC* = Avoided Energy Cost associated with the renewable resource

7. **Support Capacity Costs:** It is calculated in the same way as generation remix costs, it also has two components related to capital and production. It is calculated as difference between the capital (or production) cost in the base case and the capital (or production) cost with PV in the system (generation remix case).
8. **Regulating Reserve Requirement:** Consists of the regulating reserves required when solar PV is installed on the grid. It has two components: (1) the regulating reserve reliability impact, which depends on the expected reserve requirement as a percent of nominal DER capacity (as it is scaled by the capacity worth factor) and (2) the forecast error reliability impact, which depends on the expected DER forecast error as a percent of nominal DER capacity.

The report also highlights the need to study peak shifting and ramping issues as solar PV production increases. Other costs, such as Bottom Out Costs, Starts-Based Maintenance Costs, Planning Reserve Margin Costs, Distribution Operating Costs, and Program and Administrative Costs were given placeholder values, as Georgia Power has not developed a methodology to calculate the expected costs associated with significant penetrations of renewable resources.

**Appendix III.B: Summary of Study: *Minnesota Value of Solar: Methodology (Clean Power Research, 2014)***

Clean Power Research, on behalf of the Minnesota Department of Commerce, developed a methodology to determine the value of solar (VOS) in Minnesota. The aim was to replace the existing net metering program with a VOS rate structure. While the state developed an official methodology, no utility has yet adopted a VOS compensation structure for distributed solar customers. The categories identified and evaluated were as follows:

1. Avoided Fuel Cost
2. Avoided Plant Operation and Maintenance – Fixed
3. Avoided Plant Operation and Maintenance – Variable
4. Avoided Generation Capacity Cost
5. Avoided Reserve Capacity Cost
6. Avoided Transmission Capacity Cost
7. Avoided Distribution Capacity Cost
8. Avoided Environmental Cost
9. Placeholder for Avoided Voltage Control Costs and Solar Integration Costs

The PV output was estimated either through direct metering or simulation models with actual/expected parameters. The PV was treated as a marginal resource. If known and measurable evidence of other costs and/or benefits existed, then it was decided to incorporate them into the methodology. The end result would be a \$/kWh rate. The main components are estimated as follows:

1. **Avoided Energy** is the sum of the total fleet production on a yearly basis.
2. **Avoided Losses** are calculated on marginal bases as the difference in losses between the case with and without marginal PV resource. T&D losses are considered separately, while No Load losses are not included. A loss saving factor is calculated, based on the avoided energy with and without losses. The same is used later to derive other quantities.
3. **Avoided Fuel Costs:** The fuel that would have been required to produce the energy that has been subsequently displaced by PV. It is based on the NYMEX Futures Market. A virtual solar heat rate is computed based on the Heat rate vs energy production of each generator. This weighted heat rate is then multiplied by the burnertip fuel unit price which give the value of avoided fuel costs.
4. **Avoided O&M (Fixed and Variable):** Avoided O&M is the O&M cost (total) multiplied by the ratio of PV capacity to utility capacity. They are avoided only when the resource requiring fixed O&M is avoided. Per-unit PV production is considered with annual degradation taken into account.

5. **Avoided Generation Capacity:** The solar-weighted capacity cost is based on the installed capital cost of a peaking combustion turbine and the installed capital cost of a combined cycle gas turbine, interpolated based on heat rate.

The following formula quantifies it:

$$Cost = Cost_{CCGT} + (HeatRate_{PV} - HeatRate_{CCGT}) \times \frac{Cost_{CT} - Cost_{CCGT}}{HeatRate_{CT} - HeatRate_{CCGT}}$$

The avoided reserve margin is calculated similarly, multiplying utility costs by the reserve margin.

6. **Avoided Reserve Capacity Costs:** This is identical to the generation capacity cost calculation, except utility costs are multiplied by the reserve capacity margin.
7. **Avoided Transmission Capacity:** It is calculated on a similar way to avoided generation costs. No degradation is capacity is considered. It is based on the utility's 5-year average MISO OATT Schedule 9 charge in Start Year USD
8. **Avoided Distribution Capacity Costs:**
- a. **System-Wide Avoided Costs:** These are calculated using utility-wide costs and lead to a VOS rate that is "averaged" and applicable to all solar customers. The costs and growth rate are determined using actual data from each of the last 10 years. They must be taken over the same time period because the historical investments must be tied to the growth that led to the investments.

The amount of new distribution capacity is calculated based on the growth rate, and this is multiplied by the cost per kW to get the cost for the year. The total discounted cost is calculated and amortized over the 25 years. PV is assumed to be installed in sufficient capacity to allow this investment stream to be deferred for one year. Utility costs are calculated using the difference between the amortized costs of the conventional plan and the amortized cost of the deferred plan.

- b. **Location-Specific Avoided Costs:** These are calculated using location-specific costs, growth rates, etc., and lead to location-specific VOS rates.
9. **Avoided Environmental Costs:** Environmental costs are included as a required component and are based on existing Minnesota and EPA externality costs. CO2 and non-CO2 natural gas emissions factors (lb per MM BTU of natural gas) are taken from the EPA. The costs are adjusted for inflation (converted to current dollars), converted to dollars per short ton, and then converted to cost per unit fuel consumption using the assumed values. The externality costs are taken as the midpoint of the low and high values for the urban scenario, adjusted to current dollars, and converted to a fuel-based value

#### Proposed Formula

To calculate a utility’s Value of Solar rate, a set of avoided cost components are each multiplied by a load match factor (if one is appropriate) and a loss savings factor. Adding the results of these separate component calculations produces the utility’s total Value of Solar rate.

$$\sum \text{Avoided Cost}_{\text{component}} \times \text{Load Match Factor}_{\text{component}} \times (1 + \text{Loss Savings Factor}_{\text{component}}) = \text{Value of Solar}$$

The load match factor is 1 for energy related quantities, and it is the ELCC/PLR for demand/capacity related quantities. Figure A3 shows the value of each component calculated with this methodology. The final value of solar rate was \$0.135 per kWh.

25 Year Levelized Value	Gross Starting Value (\$/kWh)	Load Match Factor (%)	Loss Savings Factor (%)	Distributed PV Value (\$/kWh)
Avoided Fuel Cost	\$0.061		8%	\$0.066
Avoided Plant O&M - Fixed	\$0.003	40%	9%	\$0.001
Avoided Plant O&M - Variable	\$0.001		8%	\$0.001
Avoided Gen Capacity Cost	\$0.048	40%	9%	\$0.021
Avoided Reserve Capacity Cost	\$0.007	40%	9%	\$0.003
Avoided Trans. Capacity Cost	\$0.018	40%	9%	\$0.008
Avoided Dist. Capacity Cost	\$0.008	30%	5%	\$0.003
Avoided Environmental Cost	\$0.029		8%	\$0.031
Avoided Voltage Control Cost				
Solar Integration Cost				
				\$0.135

Figure A3: Minnesota Value of Solar Calculation by Component

### **Appendix III.C: Summary of Study: *Net Metering in Mississippi: Costs, Benefits, and Policy Considerations (Synapse Energy Economics, 2014)***

As part of a docket investigating the establishment of net metering and interconnection rules, the Mississippi Public Service Commission hired Synapse Energy Economics to conduct a study of the potential costs and benefits of net metering in the state. The following cost/benefit components were addressed in the study:

#### **1. Solar Integration Costs**

Synapse concluded that grid integration costs increase as solar penetration level increases. As penetration levels are low in Mississippi, the authors found a very little evidence that significant costs are incurred by grid operators or distribution companies. Synapse referred to Xcel Energy's Colorado report, which concludes DG would add \$2 per MWh in costs at a penetration level of 2%, which is four times that of Mississippi.

#### **2. Administrative Costs**

Since data on net metering costs from all states is not available or easily separable from the program costs, the authors collected cost data for energy efficiency programs from many states, which is widely available. The authors estimated that an average utility spends between 6% and 9% of energy efficiency program expenses on administrative costs (average is 7.5%). The authors compared the dataset for net metering programs in California and Vermont to their respective energy efficiency programs. Administration costs for net metering were less than energy efficiency programs, so this provides a high-end estimate. Energy efficiency programs in Mississippi cost approximately \$12 million, and 7.5% of \$12 million is \$0.9 million.

#### **3. Avoided Energy**

Avoided energy costs are estimated by multiplying the per-MWh variable operating and fuel costs of the marginal resource by the projected MWh of solar generation modeled in each year. The authors used data from the U.S. Energy Information Administration's 2014 Annual Energy Outlook (AEO) to calculate O&M costs. For fuel costs, they used AEO 2014 data to project costs on a MMBtu basis and unit heat rates to convert fuel costs to dollars per MWh.

#### **4. Avoided Generation Capacity**

Avoided generation capacity value is calculated as the contribution of solar net metering projects to increasing capacity availability within the state. The authors calculated the amount of installed capacity every year (assumed 88 MW for analysis) and calculated the number of MW that contribute to reduction in peak load by using an Effective Load Carrying Capability (ELCC) of 58%. Thus, capacity contribution will be 58% of 88MW, which is 51 MW. The authors multiplied this capacity contribution by the capacity value in each year and divided this by total solar generation in that year to yield a dollars per MWh value.

#### **5. Avoided Transmission and Distribution Capacity**

The authors used an in-house database to calculate avoided T&D costs calculated for DG and energy efficiency programs to provide a rough estimate. Average avoided transmission costs from the database were set as \$33 per kW per year. Average avoided distribution costs were \$55 per kW per Year. The database includes studies of avoided T&D costs from over 20 utilities and distribution companies. The authors developed a low, mid, and high estimate for these costs by taking the 75<sup>th</sup> percentile for the high value, the 25<sup>th</sup> percentile for low value, and the average of these two for the mid value.

#### **6. Avoided Risks/Price Hedging**

The report notes that a number of risks are reduced as a result of renewable generation. The risk reduction benefit estimation was done by applying an adder (adjustment factor) to the avoided costs rather than attempting a technical analysis. Current optimal practice supports a 10% adder to avoided costs of renewables like solar.

#### **7. Avoided System/Line losses**

Synapse's analysis estimates avoided system losses using a weighted average line loss during each daylight hour. This is calculated by weighing daylight line losses of each T&D system in proportion to the load each system serves. Avoided system losses were calculated as product of weighted average system losses and projected generation from solar panels in each year (in kWh) times the avoided energy cost (in dollars per kWh) in the same year.

#### **8. Environmental Compliance/Benefits**

Environmental benefits calculated are primarily associated with avoided CO<sub>2</sub> emissions. The authors' analysis uses the mid case of their avoided environmental compliance estimation. It is forecasted that a carbon price begins in 2020 at \$15 per ton and increases to \$60 per ton in 2040. Entergy has developed a system-wide integrated resource plan, which modeled a CO<sub>2</sub> price in its reference case. Other greenhouse gases, such as SO<sub>x</sub> and NO<sub>x</sub>, are not mentioned.

**9. Market Price Suppression**

Market price suppression effects are acknowledged in the report, but are not monetized.

**10. Local Economic Benefits**

Local economic benefits are not included. Although it is mentioned that PV provides the most job-years per average megawatt, this benefit is not monetized.

**11. Ancillary Services**

Grid support services/ancillary services are addressed in the report, but are not monetized.

**Appendix III.D: Summary of Study: *Distributed Generation – Integrated Value (DG-IV): A Methodology to Value DG on the GRID (Electric Power Research Institute and DG-IV Stakeholders, 2015)***

The purpose of the report was to select cost/benefit categories for inclusion in a framework and develop a firm analytical basis for calculating each of these categories. The stakeholders examined value of solar studies from other jurisdictions to identify categories to include. The study was limited to rooftop solar. A transparent, fair, adaptable, versatile methodology was to be created.

The stakeholders, after due deliberation, arrived at the following DG-IV components:

Categories	Description
<b>Avoided Energy</b>	Fuel, variable operations and maintenance, and start-up value
<b>Generation Capacity Deferral</b>	Capital and fixed operations and maintenance
<b>Transmission System Impact</b>	Net change (transmission required, deferred, or eliminated)
<b>Distribution System Impact</b>	Net change (distribution required, deferred, or eliminated)
<b>T&amp;D Losses</b>	Net change in T&D system losses
<b>Environmental Impact</b>	Compliance (e.g., CO <sub>2</sub> , coal ash, cooling water) and market (renewable energy credits) value
<b>Local Power Company (LPC) Costs &amp; Benefits</b>	Cost of implementing renewable energy programs (administrative, operational, engineering) and LPC-specific distribution system benefits
<b>Economic Development</b>	Regional job and economic growth
<b>Customer Satisfaction</b>	Value associated with preference, optionality, and flexibility
<b>Local Differentiation</b>	Site-specific benefits

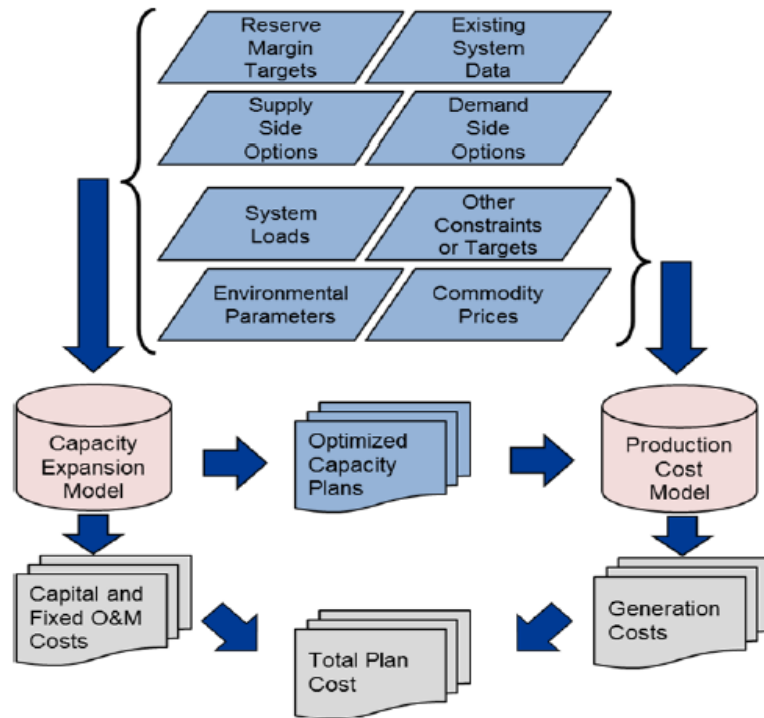

<b>System Integration/Ancillary Services</b>	Symbiotic value of smart grid and high levels of DG, as well as integration costs
<b>Additional Environmental Considerations</b>	Environmental benefits not part of the compliance and market values included above
<b>Security Enhancement</b>	Increased resiliency
<b>Disaster Recovery</b>	System restoration assistance after natural disasters
<b>Technology Innovation</b>	Impact value of technology-driven investment

- = Included in DG-IV Methodology
- = Program Design Considerations
- = Placeholder Topics

For the purpose of the report, a multiplier – Net Dependable Capacity (NDC) is used for capacity-related benefits. This multiplier is similar to the ELCC term discussed in other reports. The NDC reflects the proportion of PV capacity that offsets conventional generation capacity. The system peak and solar output at that time are compared to calculate NDC.

Evaluation of these quantities was carried out using TVA’s Resource Planning Process - [RPP] (Figure A4). The process computes two quantities (capital costs in \$/kW, and production costs \$/kWh). The net result is the Total Plan Cost. The methods used to compute the main components are as follows:

1. **Avoided Energy:** The Resource Planning Process is run with and without PV using an hourly time-step. The cost of PV is not considered. The value depends upon the avoided resource and the fuel price.
2. **Generation Deferral:** The Resource Planning Process is run with and without PV for a period of 20 years, using a 50% NDC.

**Figure A4: Resource Planning Model Process**

3. **Environmental:** This includes two components: (1) Environmental Compliance and (2) Market Value. Environmental compliance value is calculated based on the carbon intensity of the generation assets deferred, and a CO<sub>2</sub> compliance cost curve is assumed beginning in 2022. The market value is based on renewable energy credit (REC) value. A \$1/MWh value is assumed, based on national voluntary REC market prices. A 1.9% escalation rate is applied to this, based on TVA's integrated resource planning. Other environmental benefits are considered in the report, but set aside as placeholder categories.
4. **Transmission Impacts and Losses:** The costs and benefits are evaluated by considering the system peak, NDC, PV profile, and avoided costs; a simplified calculation with the point to point service rate is used. Three scenarios are studied: Positive, Negative, and Neutral, and an assumption is made that PV is installed in a manner that will be beneficial to the grid. It was generally observed that losses decrease when PV is added to loaded regions; however, they increase when PV is added to lightly loaded regions due to reverse power flow.
5. **Distribution Impacts and Losses:** System impacts, and marginal losses were studied. EPRI's Integrated Grid Initiative tool was used which incorporated feeder hosting capacity. It was observed that PV will benefit the system up to the hosting capacity after which system performance will deteriorate and need mitigation. No negative impacts were considered in the report.

**Figure A5: TVA DG-IV Calculation**

Overall, it was found that the current compensation rate for PV is higher than that calculated by the DG-IV method (see Figure A5). However, this calculation does not include the other program design considerations and placeholder categories identified by the stakeholder group, and the report notes that this value is intended to be representative and not definitive.

**Appendix III.E: Summary of Study: *Evaluation of Net Metering in Vermont Conducted Pursuant to Act 99 of 2014 (Vermont Public Service Department, 2014)***

This study was conducted by the Vermont Public Service Department with the broad purpose of evaluating net metering in the state of Vermont. The study examined six different types of net-metered systems: (1) a 4 kW fixed PV system, (2) a 4 kW 2-axis tracking PV system, (3) a 4 kW wind generator, (4) a

100 kW fixed group net metering PV system, (5) a 100 kW 2-axis tracking group net metering PV system, and (6) a 100 kW group net metering wind system.

Ultimately, the study concluded that the impact of net metering is positive, primarily for those who install distributed generation systems. The study pointed to grid stability and reliability, economic and environmental benefits (they did not attempt to quantify these due to the arbitrary nature of pricing), shared distribution between net-metering and non-net-metering customers, and the current tax credit system as primary net positives for net metering.

1. **Avoided Energy:** The authors assumed that the energy source displaced or avoided by the use of net metering is energy purchased on the ISO-NE real-time spot market. Avoided energy was calculated on an hourly basis by multiplying the production of real Vermont generators by the hourly price set in the ISO-NE market. These calculations indicated that fixed solar PV had a weighted average avoided energy price 9% lower than the annual ISO-NE average spot market price. The capacity factor for each solar technology is projected using the National Renewable Energy Laboratory's PV-Watts tool for a location in Montpelier using all default settings.
2. **Avoided Generation Capacity:** The Department examined the timing of the relevant peaks: ISO-NE's peak for capacity costs, Vermont summer peaks for in-state transmission costs, monthly Vermont peaks for Regional Network Service (RNS) costs and utility specific peak hours for distribution costs. The ability of variable generators to help avoid ISO-NE capacity costs depends on the level of generation during summer hours when ISO-NE's region wide grid demand peaks.
3. **Avoided Regional Transmission Costs:** Regional Network Service (RNS) charges are charged by ISO-NE to each of the region's utilities to pay for the cost of upgrades to the region's infrastructure. These costs are required to meet reliability standards and thus cannot be entirely avoided - only their allocation among New England ratepayers can be changed. Avoiding these costs through net metering shifts the costs to ratepayers from other states. RNS charges are allocated to each utility based on its share of the monthly peak load within Vermont. The values quantified for these costs are based on the ISO-NE forecast for the next three years' worth of RNS charges and escalated based on historical increases in the handy-Whitman Index of public utility construction costs.
4. **Avoided In-State Transmission and Distribution Costs:** These costs are incurred by the state's distribution utilities or VELCO and are not subject to regional cost allocation. Burlington Electric Department forecasts show that even without the effects of energy efficiency, there are no load growth related infrastructure investments planned for next 20 years, hence these costs have been excluded. In-state transmission and distribution upgrades deferred due to load reduction are calculated considering the critical value of how much generation the grid can rely on during peak times. Reliability peak coincidence values were calculated separately from economic peak coincidence values.
5. **Market Price Suppression:** The Department approximated this using an analysis based on the 2013 Avoided Energy supply cost study calculations of the demand reduction induced price effect for Vermont.

6. **Renewable Energy Credit Value:** A fixed value of \$30/MWh is assumed. Potential future regulatory value in REC retirement to utilities. (At the time of this study, Vermont did not have a mandatory renewable portfolio standard (RPS). In 2015, the Vermont legislature adopted a binding RPS of 75% by 2032.)
7. **Environmental Compliance:** Analysis was done for the state's non-participating ratepayers both with and without an externalized cost of greenhouse gas emissions. The authors assumed a value of \$100/metric ton of CO<sub>2</sub>.

The Department also considered three costs as part of its cost-benefit analysis:

1. **Lost Utility Revenue (Due to Reduced Bills):** The Department considered the cost of lost utility revenue due to net metering customers paying lower bills.
2. **Administrative Costs:** Administrative costs are assumed to be the same values as reported in "Evaluation of Net Metering in Vermont Conducted Pursuant to Act 125 of 2012." Wherein, it was assumed that administrative costs are composed of two types of costs: procedural and billing. The authors calculated the combined annual value as \$200,000. This corresponds to a set-up cost of approximately \$20 per kW of net metering system capacity, ongoing costs of about \$20 per kW per year for billing group net-metered systems, and no ongoing billing cost for individual net-metered systems.
3. **Vermont Solar Credit:** Credit for net excess generation is provided at the blended residential rate.

It is notable that solar integration costs are not included in the Department's analysis, particularly given that Vermont has one of the highest percentages of installed solar capacity in the country (the state's net metering aggregate capacity limit of 15% was surpassed by Green Mountain Power in 2016).

The Department carried out its analysis on various systems to determine if cross subsidization is occurring. The Department ultimately found that the aggregate net cost over 20 years to non-participating ratepayers due to net metering under the current policy framework is close to zero. Therefore, there does not need to be a direct link between the value provided by DG resources and the amount or form of compensation provided through net metering program. The Department stated that in order to achieve long-term goals for DG deployment, compensation may need to be greater than the value provided for particular technologies or time periods.

Final Status Report - SOW 3: Rankin Development  
Report: December 12, 2017  
Project Completed July 2017  
by : Green Energy Corp, John S. Camilleri

The activities of this SOW include the following:

1. Detailed Requirement Documented
2. DDS Adapters to support field communications
3. C37.118 OpenFMB Adapter + Island Detection Application
4. Implement POI Service for multiple DER on Feeder. (Modified - See below)

Task 1 and 2 were completed in 2016.

Task 3 involved creating a PMU OpenFMB Driver. The specification was produced and reviewed in 2016. The adapter was created and tested on the Mount Holly Microgrid system. The project repo (PMU Adapter) was shared with Duke Energy.

The island detection application will use local time series values within the microgrid to attempt and detect an islanding event without proper Point of Common Coupling(PCC) operation. This will be a application running on an edge node. GEC will develop the algorithm approach and deploy in Mount Holly for testing. The application will also monitor other devices in the system including the PCC and Battery System. The adapter was created and tested on the Mount Holly Microgrid system. The project repo (PMU Adapter) was shared with Duke Energy.

The charts below show the algorithm running in Mount Holly.

Task 4 will document the islanding application in Task 3 and the expected communication configuration and operation of the monitored devices. This

documentation will also consider the application in a configuration with DER on a distribution circuit.

All tasks have been completed. Code and documentation were turned over to Duke Energy. The ETO Team at Mount Holly continue to pursuing further experimentation on their own.

## Appendix A: Code Readme Documentation

Part of task #4.

Repo - PMU-Adapter

Projects:

- pmu-adapter-protocol: Library for connecting to C37 protocol connections. Implements Netty protocol handlers.
- pmu-adapter-publisher: GreenBus Edge endpoint publisher that reads PMU data and publishes aggregate statistics.
- pmu-adapter (assembly): Packages PMU adapter as runnable service.

Important classes:

- UnbufferedDes: Implements double-exponential smoothing on a time series.
- PmuTcpHandler: Netty handler that decodes PMU protocol frames and passes results to an observer.
- PmuEndpoint: Observes a PMU connection, keeping running statistics and publishing at an interval.

## Appendix B: Application Documentation

Part of task #4

### Problem Statement

---

Detecting variations in trending values can be useful for identifying anomalies in a system. In an electrical system where distributed generation is deployed certain conditions can arise that produce a safety issue. One of these conditions is called unintended islanding.

Typically this is where the main source of the feeder or microgrid has been interrupted and power is flowing backwards from the DER or Microgrid across the Point of Common Coupling (PCC). This is where the PCC did not operate or the DER did not shutdown appropriately to stop the backflow. This backflow could be feeding a low current fault, energizing a portion of the line that crews might be working on and/or damaging customer equipment due to poor power quality.

Being able to detect and then provide automatic control cost effectively is the ultimate goal.

### Approach

---

The selected approach identifies and attempts to rectify the problem uses several technologies. The first technology was developed by Green Energy Corp and allows a distributed application to run in the field on a CPU Node in front of the PMU. The second technology was implemented by Netflix to support Operational Insight for millions of trending values. Netflix implemented an algorithm call Double Exponential Smoothing (DSM) to predict and support anomaly detection.

As specified in Task #3 above, GEC will implement and deploy the approach described.

### Location of Deployment

---

Duke Energy has deployed a SEL 735 which provides C37.118. It is located between the PCC and POI at Mount Holly and will enable Duke Energy to monitor high resolution frequency and /or voltage phase angles at that location. It should be noted that this location is not part of the Microgrid so that when the Microgrid Islands the SEL 735 will still see the grid side measurements.

## Breath of Solution

This approach has numerous applications for in-field analytics. Some of the potential areas include detecting voltage anomalies at distribution transformers to determine bad windings. Identification of excess current draws on motors indicating short circuits in the armatures.

This approach can enable a low cost power quality monitoring system that can also integrate with other in-field analytics and data to predict system level behaviour.

## Basic Mathematical Approach

The Double Exponential Smoothing (DES) uses two equations<sup>[^1]</sup>

$$S_t = \alpha y_t + (1 - \alpha)(S_{t-1} + B_{t-1})$$

where  $0 \leq \alpha \leq 1$

$$B_t = \gamma(S_t - S_{t-1}) + (1 - \gamma)B_{t-1}$$

where  $0 \leq \gamma \leq 1$

Both  $\alpha$  and  $\gamma$  have to be tuned to for the specific trending variable.

The following graph from NIST shows the DSE and forecast based on DES and exponential smoothing with the actual data.

The based concept is to monitor the variation between the actual and DES forecasted to determine when the actual is *out of range* to trigger an anomaly event.

## Coding Approach

---

Green Energy Corp will take the open source version of DES from Netflix<sup>[^2]</sup> as the base algorithm. A PMU adapter will be implemented on GreenBus Edge to support communication with the the SEL 735. This is based off of previous work<sup>[^3]</sup>. There are also other implementation of DES<sup>[^4]</sup> that are liberally licensed on `github` for further consideration.

## Observations

---

The system will be able to be tuned and monitored for the Mount Holly Data Center. This will allow Duke and GEC to determine the best parameters and the limit settings for detecting anomalies of the trended values. The specific goal of this demonstration is to verify an approach to implement automatic control based on the analytics, therefore we will only implement events to be logged in the system for verification.

1 **Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

2 A. My name is Veronica I. Williams, and my business address is 550 South  
3 Tryon Street, Charlotte, North Carolina.

4 **Q. PLEASE STATE YOUR POSITION WITH DUKE ENERGY AND**  
5 **DESCRIBE YOUR CURRENT RESPONSIBILITIES.**

6 A. In my capacity as Rates and Regulatory Strategy Manager, I am responsible  
7 for providing regulatory support related to retail and wholesale rates,  
8 providing guidance on Renewable Energy and Energy Efficiency Portfolio  
9 Standard (“REPS”) compliance and cost recovery for Duke Energy Progress,  
10 LLC (“Duke Energy Progress,” “DEP,” or the “Company”) and Duke Energy  
11 Carolinas, LLC (“Duke Energy Carolinas” or “DEC”), and preparing and  
12 filing testimony and exhibits in annual DEP and DEC REPS rider  
13 proceedings.

14 **Q. PLEASE BRIEFLY SUMMARIZE YOUR EDUCATIONAL**  
15 **BACKGROUND, BUSINESS BACKGROUND AND PROFESSIONAL**  
16 **AFFILIATIONS.**

17 A. I received a Bachelor of Science degree in Business from the University of  
18 North Carolina at Charlotte. I am a certified public accountant licensed in the  
19 state of North Carolina. I began my career with Duke Power Company (now  
20 known as Duke Energy Carolinas) as an internal auditor and subsequently  
21 worked in various departments in the finance organization. I joined the Rates  
22 Department in 2001.

1 **Q. HAVE YOU PREVIOUSLY TESTIFIED BEFORE THE NORTH**  
2 **CAROLINA UTILITIES COMMISSION?**

3 A. Yes. I most recently provided testimony in Docket No. E-7, Sub 1162  
4 regarding Duke Energy Carolinas' 2017 REPS compliance report and  
5 application for approval of its REPS cost recovery rider, and in Docket No. E-  
6 2, Sub 1144 regarding Duke Energy Progress' 2016 REPS compliance report  
7 and application for approval of its REPS cost recovery rider.

8 **Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?**

9 A. The purpose of my testimony is to describe the calculation of and present the  
10 support for the REPS rider proposed by Duke Energy Progress under N.C.  
11 Gen. Stat. ("G.S.") § 62-133.8 and to present the information and data  
12 required by Commission Rule R8-67 as set forth in Williams Exhibit Nos. 1  
13 through 4. The test period used in supplying this information and data is the  
14 twelve months beginning on April 1, 2017 and ending on March 31, 2018  
15 ("Test Period" or "EMF Period"), and the billing period for the REPS rider  
16 requested in the Company's application is the twelve months beginning on  
17 December 1, 2018 and ending on November 30, 2019 ("Billing Period").

18 **Q. PLEASE DESCRIBE THE EXHIBITS TO YOUR TESTIMONY.**

19 A. Williams Confidential Exhibit No. 1 ("Williams Exhibit No. 1") identifies the  
20 total incremental REPS compliance costs for which the Company seeks  
21 recovery from Duke Energy Progress North Carolina Retail ("NC Retail")  
22 customers. Williams Confidential Exhibit No. 2 ("Williams Exhibit No. 2")  
23 shows the allocation of the total REPS compliance costs, identified in

1 Williams Exhibit No. 1, to the Company's NC Retail customer classes for the  
2 Test Period. Williams Confidential Exhibit No. 3 ("Williams Exhibit No. 3")  
3 shows the allocation of the total expected REPS compliance costs, identified  
4 on Williams Exhibit No. 1, to the Company's NC Retail customer classes for  
5 the Billing Period. Williams Exhibit No. 4 shows the total REPS rider  
6 amounts proposed, including the REPS Experience Modification Factor  
7 ("EMF"), by customer class, compared to the cost cap for each customer  
8 class. Finally, Williams Exhibit No. 5 is a worksheet detailing the Company's  
9 energy efficiency certificate ("EEC") inventory balance as of December 31,  
10 2017.

11 **Q. WERE THESE EXHIBITS PREPARED BY YOU OR AT YOUR**  
12 **DIRECTION AND UNDER YOUR SUPERVISION?**

13 A. Yes.

14 **Q. WHAT COSTS ARE INCLUDED IN DUKE ENERGY PROGRESS'**  
15 **PROPOSED REPS RIDER?**

16 A. The proposed REPS rider intends to recover Duke Energy Progress'  
17 incremental costs of compliance with the renewable energy requirements  
18 pursuant to G.S. § 62-133.8. The rider includes the REPS EMF component to  
19 recover the difference between the compliance costs incurred and revenues  
20 realized during the Test Period. The costs incurred during the Test Period are  
21 presented in this filing to demonstrate their reasonableness and prudence as  
22 provided in Rule R8-67(e). The proposed rider also includes a component to  
23 recover the costs expected to be incurred for the Billing Period.

1 **Q. PLEASE DESCRIBE THE METHODOLOGY DUKE ENERGY**  
2 **PROGRESS USED TO CALCULATE THE INCREMENTAL COSTS**  
3 **OF COMPLIANCE WITH THE REPS REQUIREMENTS.**

4 A. Company Witness Jennings describes the costs Duke Energy Progress  
5 incurred during the Test Period and the costs it projects to incur during the  
6 Billing Period to comply with its REPS requirements. General Statute § 62-  
7 133.8(h)(1) provides that “incremental costs” means “all reasonable and  
8 prudent costs incurred by an electric power supplier” to comply with the  
9 REPS requirements “that are in excess of the electric power supplier’s  
10 avoided costs other than those costs recovered pursuant to G.S. § 62-133.9.”

11 For purchased power agreements with renewable energy facilities,  
12 Duke Energy Progress subtracted its avoided cost, as determined pursuant to  
13 R8-67(a)(2), from the total cost associated with each renewable energy  
14 purchase to arrive at the incremental cost related to the renewable energy  
15 purchase during the period in question. For biogas purchases forecast to be  
16 used to generate renewable energy at the Company’s generating stations, the  
17 incremental cost is calculated by subtracting the applicable avoided cost from  
18 the total biogas cost associated with the MWhs generated.

19 With respect to the Company’s utility-owned solar generating  
20 facilities, an annual revenue requirement, including capital and operations and  
21 maintenance costs, was calculated for each facility for the period covering the  
22 expected service life of the project. The present value of the total project  
23 revenue requirement was levelized over the project life to produce a level

1 annual revenue requirement that was compared to avoided cost to determine  
2 any annual incremental cost subject to cost recovery through the REPS rider.

3 Consistent with Rule R8-67(e)(2), which provides that the cost of an  
4 unbundled renewable energy certificate (“REC”) “is an incremental cost and  
5 has no avoided cost component,” the total cost for REC purchases incurred  
6 during the Test Period is included in incremental costs. Further, the projected  
7 costs for REC purchases during the Billing Period are included as incremental  
8 costs.

9 As described in detail by Company Witness Jennings in her direct  
10 testimony filed in this docket, the REPS EMF and Billing Period components  
11 of the proposed REPS rider also include compliance-related incremental  
12 administration costs, labor costs, and costs related to research incurred during  
13 the EMF Period and estimated for the Billing Period, respectively.  
14 Additionally, as further detailed in the testimony of Witness Jennings, an  
15 amount equal to the annual amortization of Solar Rebate Program costs  
16 incurred pursuant to G.S. § 62-155(f) applicable to the Billing Period is also  
17 included for recovery in the proposed REPS rider.

18 **Q. WHAT CONDITIONS RELEVANT TO THIS PROCEEDING DID THE**  
19 **COMMISSION INCLUDE IN ITS APPROVAL OF THE**  
20 **CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY FOR**  
21 **EACH OF THE COMPANY’S SOLAR GENERATING FACILITIES?**

22 A. The Company’s Fayetteville, Warsaw, Camp Lejeune, and Elm City solar  
23 generating facilities (“DEP Solar PV Facilities”) were in service for the  
24 duration of the Test Period. The Commission included two conditions related

1 to cost recovery for the DEP Solar PV Facilities in its December 16, 2014  
2 orders approving the transfer of each Certificate of Public Convenience and  
3 Necessity (“CPCN”) in Docket Nos. E-2, Subs 1054, 1055, 1056,  
4 respectively, and in its April 14, 2015 order issuing a CPCN in Docket No. E-  
5 2, Sub 1063 (collectively, the “CPCN Orders”). The first condition addressed  
6 the avoided cost values to be used by the Company in subsequent calculations  
7 of the avoided and incremental components of total cost for each of the  
8 facilities. The Company agreed that, in the appropriate REPS rider and  
9 general rate case proceedings, it would determine the levelized avoided cost  
10 per MWh for each facility by using the same avoided energy and capacity cost  
11 values included in the Company’s analysis of the revenue requirements for  
12 each facility, as presented during the CPCN proceedings. The second  
13 condition relates to DEP’s ability to realize certain tax benefits included in the  
14 Company’s revenue requirements analysis for each facility as presented  
15 during the CPCN proceedings. The condition provides that, in the appropriate  
16 REPS rider and general rate case proceedings, DEP will separately itemize the  
17 actual monetization of the tax benefits listed in the Commission’s orders  
18 within its calculation of the levelized revenue requirement per MWh for each  
19 facility, so that it may be compared with the monetization of such tax benefits  
20 included in the Company’s revenue requirement analysis of each facility  
21 presented during the CPCN proceedings. To the extent the Company fails to  
22 fully realize the tax benefits it originally assumed in its estimated revenue  
23 requirements, costs associated with the increased revenue requirements (with

1 a limited exception) will be presumed to be imprudent and unreasonably  
2 incurred. The condition further provides that DEP may rebut this presumption  
3 with evidence supporting the reasonableness and prudence of its actual  
4 monetization of the tax credits.

5 **Q. DID THE COMPANY COMPLY WITH THE TWO CONDITIONS**  
6 **OUTLINED ABOVE IN THE APPROPRIATE REPS RIDER AND**  
7 **GENERAL RATE CASE PROCEEDINGS?**

8 A. Yes. In the Company's 2016 annual REPS rider filing in Docket No. E-2, Sub  
9 1109 and its 2017 annual REPS rider filing in Docket No. E-2, Sub 1144, the  
10 Company updated its original models of estimated annual revenue  
11 requirements to reflect its actual experience to date with regard to each of the  
12 specified tax-related benefits, and the Company updated its estimates of the  
13 timing of realization of the relevant tax benefits in future tax years. In  
14 addition, the avoided cost components of the revenue requirement calculations  
15 updated in these REPS rider dockets were fixed at the levels included in the  
16 original CPCN revenue requirement calculations, as required by the CPCN  
17 Orders. In each docket, the updated annual levelized revenue requirement for  
18 each project remained below the annual levelized avoided cost, and no  
19 incremental REPS cost was included for recovery in the respective REPS  
20 rider.

21 On June 1, 2017, DEP filed its *Application for Adjustment in Rates*  
22 *and Request for Accounting Order* in Docket No. E-2, Sub 1142, the  
23 Company's first and only general rate case proceeding since the date of the

1 CPCN Orders. The DEP Solar PV Facilities costs were included in total in  
2 the revenue requirement calculated and subject to recovery in base rates in the  
3 general rate case docket. The Commission issued its February 23, 2018 *Order*  
4 *Accepting Stipulation, Deciding Contested Issues and Granting Partial Rate*  
5 *Increase* in Docket No. E-2, Sub 1142, in which the Commission accepted  
6 DEP's conclusion that the facility costs included in its proposed base rates  
7 were prudently incurred and approved recovery through base rates. The  
8 Company is including no recovery of costs related to the DEP Solar PV  
9 Facilities in its current REPS rider filing, and respectfully submits that it has  
10 now met in full the cost recovery conditions of the CPCN Orders, and its  
11 compliance requirement is completed.

12 **Q. PLEASE DESCRIBE HOW DUKE ENERGY PROGRESS**  
13 **ALLOCATES INCREMENTAL REPS COSTS AMONG CUSTOMER**  
14 **CLASSES FOR REPS AND REPS EMF RIDER PURPOSES.**

15 A. Incremental costs assigned to Duke Energy Progress' NC Retail customers are  
16 separated into two categories: costs related to solar, poultry waste, and swine  
17 waste compliance requirements, and research and other incremental and Solar  
18 Rebate costs ("Set-Aside and Other Incremental Costs"); and costs related to  
19 the General Requirement<sup>1</sup> ("General Incremental Costs"). This separation is  
20 calculated in Williams Exhibit No. 1.

21 Set-Aside and Other Incremental Costs are allocated among customer  
22 classes based on per-account cost caps. General Incremental Costs are

---

<sup>1</sup> The Company generally refers to the "General Requirement" as its overall REPS requirement, set forth in N.C. Gen. Stat. § 62-133.8(b), net of the three set-asides.

1 allocated among customer classes in a manner that gives credit for EE RECs  
2 (for which there are no General Incremental Costs) according to the relative  
3 energy reduction contributed by each customer class. As a result, General  
4 Incremental Costs are allocated among customer classes based on each class'  
5 pro-rata share of requirements for non-EE general RECs. The calculations for  
6 allocating General Incremental Costs reflect the updated method  
7 recommended by the Public Staff, and accepted by the Commission in its  
8 November 17, 2017 *Order Approving REPS and REPS EMF Rider and*  
9 *Approving REPS Compliance Report* ("2017 DEP REPS Order"), in DEP's  
10 2017 REPS rider filing in Docket No. E-2, Sub 1144.

11 In the 2017 DEP REPS Order (at p. 20), the Commission further  
12 directed that:

13 DEP and the Public Staff shall together evaluate the inputs and  
14 methods used for the allocation of EE RECs by class, as well  
15 as the allocation of the set-aside and general requirement cost  
16 categories to customer class, and identify any further revisions  
17 required. DEP and the Public Staff shall file the results of this  
18 analysis no later than April 1, 2018, for use in the 2018 DEP  
19 REPS rider.  
20

21 The Commission subsequently extended the deadline for filing this  
22 analysis to April 16, 2018 in its April 10, 2018 *Order Granting Motion for*  
23 *Extension of Time* in the same docket. The Public Staff and the Company  
24 then filed a *Joint Report of the Public Staff and Duke Energy Progress, LLC*  
25 on April 12, 2018 ("Joint Report"), explaining the evaluation performed and  
26 method agreed to, and requesting Commission acceptance of the method  
27 described. The request is currently pending review by the Commission; the

1 process identified in the Joint Report is incorporated in this current DEP  
2 REPS rider filing.

3 The Company notes that any deviation from allocating costs according  
4 to the statutory per-account cost cap ratios creates the potential for the  
5 resulting charges computed for one or more classes to exceed the per-account  
6 cost cap(s). If that occurs, the Company would continue to reallocate the  
7 costs in excess of the cap for the affected customer class to the other customer  
8 classes to the extent required to produce charges for all classes that do not  
9 exceed the respective caps.

10 **Q. PLEASE DESCRIBE HOW DUKE ENERGY PROGRESS**  
11 **CALCULATED THE PROJECTED PORTION OF THE REPS RIDER**  
12 **THAT THE COMPANY PROPOSES FOR THE BILLING PERIOD.**

13 A. Using the allocation methods described above, and as shown on Williams  
14 Exhibit No. 3, the Set-Aside and Other Incremental Costs and the General  
15 Incremental Costs are calculated by customer class for the Company's NC  
16 Retail customers. The Set-Aside and Other Incremental Costs and General  
17 Incremental Costs are summed for the Billing Period by customer class to  
18 arrive at a total REPS cost to be collected from the Company's NC Retail  
19 customers. On Williams Exhibit No. 4, the cost allocated to each customer  
20 class is then divided by the total projected number of Duke Energy Progress  
21 NC Retail accounts within each customer class to arrive at the total annual  
22 cost to be recovered from each account over the Billing Period. The monthly

1 NC Retail REPS rider for each customer class is one-twelfth of the total  
2 annual cost.

3 **Q. PLEASE EXPLAIN THE CALCULATION OF THE PROPOSED REPS**  
4 **EMF.**

5 A. Using the allocation methods described above, and as shown on Williams  
6 Exhibit No. 2, the Set-Aside and Other Incremental Costs and the General  
7 Incremental Costs are calculated by customer class for the Company's NC  
8 Retail customers. The Set-Aside and Other Incremental Costs and General  
9 Incremental Costs are summed for the Test Period by customer class to  
10 illustrate the total REPS cost assigned to the Company's NC Retail customers.  
11 The actual NC Retail revenues realized during the Test Period by customer  
12 class are then subtracted from the total REPS costs by customer class to arrive  
13 at the EMF for each class. On Williams Exhibit No. 4, the total EMF  
14 over/under collection to be recovered from each customer class is adjusted to  
15 include any credits to customers not considered a refund of amounts advanced  
16 by customers, and then divided by the total projected number of Duke Energy  
17 Progress NC Retail accounts within each customer class to arrive at the total  
18 EMF to be recovered from each account over the Billing Period. The monthly  
19 EMF for each customer class is one-twelfth of the total EMF.

20 **Q. DOES DUKE ENERGY PROGRESS DEFINE A "CUSTOMER" FOR**  
21 **PURPOSES OF REPS BILLING IN ACCORDANCE WITH THE**  
22 **COMMISSION'S ORDER ISSUED NOVEMBER 12, 2009 IN DOCKET**  
23 **NO. E-2, SUB 948?**

1 A. Yes. Consistent with the Commission's order issued November 12, 2009 in  
2 Docket No. E-2, Sub 948, for purposes of REPS billing, a customer is defined  
3 as all accounts (metered and unmetered) serving the same customer of the  
4 same revenue classification located on the same or contiguous properties. If a  
5 customer has accounts that serve in an auxiliary role to a main account on the  
6 same premises, no REPS charge applies to the auxiliary accounts, regardless  
7 of their revenue classification. Upon written notification from the customer,  
8 accounts meeting these criteria are coded in the billing system to allow the  
9 customer to receive only one monthly REPS charge for all identified accounts.

10 **Q. DOES THE COMPANY PROJECT THE REPS CHARGE TO EACH**  
11 **CUSTOMER ACCOUNT FOR THE BILLING PERIOD TO BE**  
12 **WITHIN THE ANNUAL COST CAPS DEFINED IN N.C. GEN. STAT.**  
13 **§ 62-133.8?**

14 A. Yes. In NC House Bill 589, the General Assembly revised G.S. § 62-  
15 133.8(h)(4) to lower the annual cost cap for the Residential customer class  
16 from \$34.00 to \$27.00 in years subsequent to 2014, for cost recovery  
17 proceedings initiated on or after July 1, 2017. Accordingly, the Company has  
18 applied that revision to the cost caps in this cost recovery proceeding. As  
19 shown in Williams Exhibit No. 4, the annual charge for each customer class,  
20 including regulatory fee, is below the per-account cap as defined in N.C. Gen.  
21 Stat. § 62-133.8.

22 **Q. HOW DOES DUKE ENERGY PROGRESS PROPOSE TO COLLECT**  
23 **THE REPS CHARGES FROM EACH CUSTOMER CLASS?**

1 A. The Company proposes a fixed monthly charge be added to the bill for each  
2 class of customer.

3 **Q. WHAT IS THE MONTHLY REPS CHARGE PROPOSED BY THE**  
4 **COMPANY FOR EACH CUSTOMER CLASS?**

5 A. The Company proposes the following monthly REPS charges to be effective  
6 December 1, 2018. All amounts below include the regulatory fee.

Customer class	Proposed monthly REPS rider	Proposed annual REPS charge	Annual per account cost cap
Residential	\$ 1.42	\$ 17.04	\$ 27.00
General	\$ 7.96	\$ 95.52	\$150.00
Industrial	\$ 73.17	\$ 878.04	\$ 1,000.00

7

8 **Q. WHAT IS THE CHANGE IN THE MONTHLY REPS CHARGE**  
9 **PROPOSED BY THE COMPANY FOR EACH CUSTOMER CLASS?**

10 A. The following tables show the proposed monthly REPS rider charges, and a  
11 comparison to the monthly REPS rider charges currently in effect – with and  
12 without the regulatory fee applied.

13 *Excluding regulatory fee:*

Customer class	Proposed REPS rider	REPS rider in effect through November 30, 2018	Proposed increase
	(a)	(b)	(a) – (b)
Residential	\$ 1.42	\$ 0.55	\$ 0.87
General	\$ 7.95	\$ 6.41	\$ 1.54
Industrial	\$ 73.07	\$ 58.63	\$ 14.44

14

15 *Including regulatory fee:*

Customer class	Proposed REPS rider	REPS rider in effect through November 30, 2018	Proposed increase
	(a)	(b)	(a) – (b)
Residential	\$ 1.42	\$ 0.55	\$ 0.87
General	\$ 7.96	\$ 6.42	\$ 1.54
Industrial	\$ 73.17	\$ 58.71	\$ 14.46

1   **Q.   PLEASE DESCRIBE THE EEC INVENTORY DETAILS PRESENTED**  
2   **IN WILLIAMS EXHIBIT NO. 5.**

3   A.   Williams Exhibit No. 5 shows a reconciliation of the Company's EEC  
4   inventory balance available for REPS compliance as of December 31, 2017,  
5   as well as references to the evaluation, measurement and verification  
6   ("EM&V") reports the results of which are incorporated into current EEC  
7   balances. The Company annually determines the level of EECs generated and  
8   available for REPS compliance, and this update includes the results of any  
9   periodic EM&V performed to-date, adjustments identified in the course of the  
10   Company's ongoing analysis of energy efficiency program effectiveness, as  
11   well as any other corrections. In compliance with the Commission's January  
12   17, 2017 *Order Approving REPS and REPS EMF Rider and REPS*  
13   *Compliance Report* in the Duke Energy Progress REPS Docket No. E-2, Sub  
14   1109, the Company's EEC inventory includes only savings generated as  
15   limited by the life of the respective measure or program, as established in  
16   DEP's energy efficiency proceedings held pursuant to G.S. § 62-133.9. The  
17   updated cumulative level of EECs generated to date is compared to the  
18   number of EECs previously reported for compliance, less any EECs used for  
19   compliance, to determine the EECs to be added to inventory in the North  
20   Carolina Renewable Energy Certificate Tracking System for the most recent  
21   calendar year. Williams Exhibit No. 5 shows the calculation of EECs added  
22   to inventory for 2017, including details of the adjustments incorporated  
23   therein.

- 1 Q. DOES THIS CONCLUDE YOUR TESTIMONY?
- 2 A. Yes.
