

**BEFORE THE  
NORTH CAROLINA UTILITIES COMMISSION  
RALEIGH, NORTH CAROLINA**

**CHERRY SOLAR, LLC  
DOCKET NO. EMP-115, SUB 0**

**PRE-FILED SUPPLEMENTAL TESTIMONY  
OF  
LINDA NWADIKE**

**March 10, 2021**

**INTRODUCTION**

2   **Q. PLEASE STATE YOUR NAME, TITLE, AND BUSINESS ADDRESS.**

3   A. My name is Linda Nwadike. I am the Director of Permitting and Community  
4   Relations for SunEnergy1, LLC (“SunEnergy1” or the “Company”), the parent  
5   and an affiliate of the Applicant Cherry Solar, LLC (“Cherry Solar”). Cherry  
6   Solar is a North Carolina limited liability company that was formed on September  
7   24, 2020. My business address is 192 Raceway Drive, Mooresville, North  
8   Carolina 28117.

9   **Q1. Are there any network upgrades to DENC’s or any affected system’s  
10 transmission system required to accommodate the operation of the  
11 Applicant’s proposed facility? If so, provide the amount of network upgrades  
12 on DENC’s or any affected system’s transmission system, if any, required to  
13 accommodate the operation of the Applicant’s proposed facility.**

14   A. PJM queue AC1-086 has six network upgrades for Dominion system  
15   reinforcements in Virginia and North Carolina, for which this generation project  
16   has been allocated a cost responsibility of \$2,676,883.

17   The system reinforcements are as follows:

- 18   i. Uprate/rebuild 1.28 miles of the Lakeview-Carolina 230kV line 2141
- 19   ii. Replace a wave trap at Chickahominy substation for Chickahominy-Elmont  
20   500kV line #557
- 21   iii. Replace a wave trap at North Anna Substation for Midlothian-North Anna  
22   500kV line #576
- 23   iv. Install a second, back to back breaker between existing line positions #241

- 1       and #2141 at the Lakeview substation
- 2       v. Replace the Elmont-Ladysmith 500kV line #574 wavetraps
- 3       vi. Replace Battleboro substation terminal equipment.
- 4   **Q2. If there are any required system upgrades does the Applicant have Levelized**
- 5   **Cost of Transmission (LCOT) information for the system upgrades? If so,**
- 6   **provide the LCOT information for any required transmission system**
- 7   **upgrades or modifications.**
- 8   A. Please see Exhibit 1
- 9   **Q3. Is there any interconnection study available for the proposed facility? If so,**
- 10   **provide any interconnection study received for the proposed facility. If the**
- 11   **Applicant has not received a study, provide a date by when the study is**
- 12   **expected to be completed.**
- 13   A. AC1-086 System Impact Study, Facilities Study and Feasibility Study are each
- 14   attached as Exhibits 2, 3 & 4, respectively.
- 15   **Q4. Is the Applicant aware of any system other than the studied system that is or**
- 16   **will be affected by the interconnection? If yes, explain the impact and basis.**
- 17   A. PJM Queue AC1-086 has completed the PJM study process and a PJM ISA has
- 18   been tendered. The PJM System Impact Study identified a contribution to a
- 19   previously identified overload on the Battleboro – Rocky Mount 115kV tie line.
- 20   The PJM Facilities Study Agreement required the Applicant to enter into an
- 21   Affected System Facilities Study with DEP. PJM's ISA does not require the
- 22   Applicant to resolve this affected system overload. The ISA recites that the AC1-
- 23   086 generation output may be curtailed until this overload is resolved.

1 DEP has issued a Generator Interconnection Affected System Study Report  
2 identifying five PJM AC1 queue projects as needing to resolve the overload on  
3 the Battleboro – Rocky Mount 115kV line. The AC1-086 queue is one of the five  
4 identified PJM queue projects. Although the AC1-086 project benefits from the  
5 resolution of the Battleboro – Rocky Mount 115kV line rebuild, the AC1-086  
6 project does not trigger the need for this work. PJM System Impact restudies  
7 identify this overload as existing prior to the studies for the AC1-034 queue,  
8 which was the first project identified in the DEP report. The DEP report does not  
9 identify the loading on the Battleboro – Rocky Mount 115kV line prior to the  
10 PJM AC1 queue. See Exhibit 5

11 **Q5. Is the Applicant proposing to sell energy and capacity from the facility to a  
12 distribution utility regulated by the Commission? If so, provide a discussion  
13 of how the facility's output conforms to or varies from the regulated utility's  
14 most recent IRP.**

15 A. No, the Applicant does not propose to sell energy or capacity from the facility to a  
16 distribution utility regulated by this Commission.

17 **Q6. Is the Applicant proposing to sell energy and capacity from the proposed  
18 facility to a distribution utility not regulated by the Commission but serving  
19 retail customers in North Carolina (e.g. co-op or muni)? If so, discuss how  
20 the facility's output conforms to or varies from the purchasing distribution  
21 utility's long-range resource plan.**

1 A. No, the Applicant does not propose to sell energy or capacity from the facility to a  
2 distribution utility that is not regulated by this Commission but serves retail  
3 customers in North Carolina.

4 **Q7. Is the Applicant proposing to sell energy and capacity from the**  
5 **proposed facility to a purchaser who is subject to a statutory or regulatory**  
6 **mandate with respect to its energy sourcing (e.g., a REPS requirement or**  
7 **Virginia's new statutory mandate for renewables)? If so, explain how, if at,**  
8 **the proposed facility will assist or enable compliance with the mandate. In**  
9 **addition, provide any contracts that support that compliance.**

10 A. No, the Applicant is not proposing to sell energy or capacity from the proposed  
11 facility to a purchaser who is subject to a statutory mandate with respect to its  
12 energy sourcing.

13 **Q8. Does the Applicant have an PPA agreements, REC sale contracts, or**  
14 **contracts for compensation for environmental attributes for the output of the**  
15 **proposed facility? If so, provide any PPA agreements, REC sale contracts, or**  
16 **contracts for compensation for environmental attributes for the output of the**  
17 **facility.**

18 A. The Applicant has a PPA agreement. A copy of the body of that PPA agreement is  
19 attached as Exhibit 6.

20 **Q. DOES THIS CONCLUDE YOUR SUPPLEMENTAL TESTIMONY?**

21 A. Yes.

*Generation Interconnection  
System Impact Study Report*

*For*

*PJM Generation Interconnection Request  
Queue Position AC1-086*

*Thelma 230kV  
123.7MW Capacity / 180MW Energy*

January 2018

Revised August 2020

## Introduction

This System Impact Study (SIS) has been prepared in accordance with the PJM Open Access Transmission Tariff, Section 205, as well as the System Impact Study Agreement between Gaston Green Acres Solar, LLC, the Interconnection Customer (IC) and PJM Interconnection, LLC (PJM), Transmission Provider (TP). The Interconnected Transmission Owner (ITO) is Virginia Electric and Power Company (VEPCO).

## Preface

The intent of the System Impact Study is to determine a plan, with approximate cost and construction time estimates, to connect the subject generation interconnection project to the PJM network at a location specified by the IC. As a requirement for interconnection, the IC may be responsible for the cost of constructing Network Upgrades, which are facility additions, or upgrades to existing facilities, that are needed to maintain the reliability of the PJM system. All facilities required for interconnection of a generation interconnection project must be designed to meet the technical specifications (on PJM web site) for the appropriate transmission owner.

In some instances an IC may not be responsible for 100% of the identified network upgrade cost because other transmission network uses, e.g. another generation interconnection or merchant transmission upgrade, may also contribute to the need for the same network reinforcement. The possibility of sharing the reinforcement costs with other projects may be identified in the Feasibility Study, but the actual allocation will be deferred until the System Impact Study is performed.

The System Impact Study estimates do not include the feasibility, cost, or time required to obtain property rights and permits for construction of the required facilities. The IC is responsible for the right of way, real estate, and construction permit issues. For properties currently owned by Transmission Owners, the costs may be included in the study.

## General

The IC has proposed a solar generating facility located in Gaston, NC (Northampton County). The installed facilities will have a total capability of 300 MW with 207.7 MW of this output being recognized by PJM as capacity. This queue request is for an additional 180 MW with 123.7 MW of this output being recognized by PJM as capacity. The proposed in-service date for this project is 12/31/2017. **This study does not imply an ITO commitment to this in-service date.**

## Point of Interconnection

AC1-086 will interconnect with the ITO transmission system via a tap into Thelma 230kV substation.

## **Cost Summary**

The AC1-086 interconnection request will be responsible for the following costs:

Description	Total Cost
Attachment Facilities	\$ 0
Direct Connection Network Upgrades	\$ 0
Non Direct Connection Network Upgrades	\$ 0
Allocation for New System Upgrades	\$ 2,653,570
Contribution for Previously Identified Upgrades	\$ 23,313
<b>Total Costs</b>	<b>\$ 2,676,883</b>

PJM OATT 217.3 outlines cost responsibility for Network Upgrades and as the minimum amount of Network Upgrades required to resolve a single reliability criteria violation will not meet or exceed \$5,000,000 such costs shall be allocated to those Interconnection Requests in the New Services Queue that contribute to the need for such upgrades. Such allocations shall be made in proportion to each Interconnection Request's megawatt contribution to the need for these upgrades subject to the rules for minimum cost allocation thresholds in the PJM Manuals. For the purpose of applying the \$5,000,000 threshold, each reliability criteria violation shall be considered separately.

## **Attachment Facilities**

The scope identified in queue AB1-132 is sufficient to accommodate this queue request from an Attachment Facilities and Thelma substation expansion perspective. The single line is shown below in Attachment 1.

## **Interconnection Customer Requirements**

ITO's Facility Interconnection Requirements as posted on PJM's website  
<http://www.pjm.com/~/media/planning/plan-standards/private-dominion/facility-connection-requirements1.ashx>

An Interconnection Customer entering the New Services Queue on or after October 1, 2012 with a proposed new Customer Facility that has a Maximum Facility Output equal to or greater than 100 MW shall install and maintain, at its expense, phasor measurement units (PMUs). See Section 8.5.3 of Appendix 2 to the Interconnection Service Agreement as well as section 4.3 of PJM Manual 14D for additional information.

Voltage Ride Through Requirements - The Customer Facility shall be designed to remain in service (not trip) for voltages and times as specified for the Eastern Interconnection in Attachment 1 of NERC Reliability Standard PRC-024-1, and successor Reliability Standards, for both high and low voltage conditions, irrespective of generator size, subject to the permissive trip exceptions established in PRC-024-1 (and successor Reliability Standards).

Frequency Ride Through Requirements - The Customer Facility shall be designed to remain in service (not trip) for frequencies and times as specified in Attachment 2 of NERC Reliability Standard PRC-024-1, and successor Reliability Standards, for both high and low frequency condition, irrespective of generator size, subject to the permissive trip exceptions established in PRC-024-1 (and successor Reliability Standards).

Reactive Power - The Generation Interconnection Customer shall design its non-synchronous Customer Facility with the ability to maintain a power factor of at least 0.95 leading to 0.95 lagging measured at the generator's terminals.

Meteorological Data Reporting Requirement - The solar generation facility shall, at a minimum, be required to provide the Transmission Provider with site-specific meteorological data including:

- Temperature (degrees Fahrenheit)
- Atmospheric pressure (hectopascals)
- Irradiance
- Forced outage data

## **Revenue Metering and SCADA Requirements**

### **PJM Requirements**

The Interconnection Customer will be required to install equipment necessary to provide Revenue Metering (KWH, KVARH) and real time data (KW, KVAR) for IC's generating Resource. See PJM Manuals M-01 and M-14D, and PJM Tariff Sections 24.1 and 24.2.

### **Interconnected Transmission Owner Requirements**

Metering and SCADA/Communication equipment must meet the requirements outlined in section 3.1.6 Metering and Telecommunications of ITO's Facility Connection Requirement NERC Standard FAC-001 which is publically available at [www.dom.com](http://www.dom.com).

## Network Impacts

The Queue Project AC1-086 was evaluated as a 180.0 MW (Capacity 123.7 MW) injection at Thelma 230kV substation in the ITO area. Project AC1-086 was evaluated for compliance with applicable reliability planning criteria (PJM, NERC, NERC Regional Reliability Councils, and Transmission Owners). Project AC1-086 was studied with a commercial probability of 100%. Potential network impacts were as follows:

### Contingency Descriptions

The following contingencies resulted in overloads:

## Short Circuit

(Summary of impacted circuit breakers)

New circuit breakers found to be over-duty:

None

Contributions to previously identified circuit breakers found to be over-duty:

None

## Contribution to Previously Identified Overloads

(This project contributes to the following contingency overloads, i.e. "Network Impacts", identified for earlier generation or transmission interconnection projects in the PJM Queue)

#	Contingency		Affected Area	Facility Description	Bus			Power Flow	Loading %		Rating		MW Contribution	Flowgate Appendix

## Steady-State Voltage Requirements

(Summary of the VAR requirements based upon the results of the steady-state voltage studies)

None

## Stability and Reactive Power Requirement for Low Voltage Ride Through

(Summary of the VAR requirements based upon the results of the dynamic studies)

No mitigations were found to be required.

## New System Reinforcements

(Upgrades required to mitigate reliability criteria violations, i.e. Network Impacts, initially caused by the addition of this interconnection request)

## Potential Congestion due to Local Energy Deliverability

PJM also studied the delivery of the energy portion of this interconnection request. Any problems identified below are likely to result in operational restrictions to the project under study. The IC can proceed with network upgrades to eliminate the operational restriction at their discretion by submitting a Merchant Transmission Interconnection request.

Note: Only the most severely overloaded conditions are listed below. There is no guarantee of full delivery of energy for this interconnection request by addressing only the conditions listed in this section. With a Transmission Interconnection Request, a subsequent analysis will be performed which shall study all overload conditions associated with the overloaded element(s) identified.

## **Light Load Analysis in 2020**

Not required

### **ITO Analysis**

ITO assessed the impact of the proposed Queue Project #AC1-086 interconnection of 180 MW of energy (Capacity 123.7 MW) for compliance with reliability criteria on ITO's Transmission System. The system was assessed using the summer 2020 RTEP case provided to ITO by PJM. When performing a generation analysis, ITO's main analysis will be load flow study results under single contingency and multiple facility contingency (both normal and stressed system conditions). ITO Criteria considers a transmission facility overloaded if it exceeds 94% of its emergency rating under normal and stressed system conditions. A full listing of ITO's Planning Criteria and interconnection requirements can be found in the ITO's Facility Connection Requirements which are publicly available at: <http://www.dom.com>.

The results of these studies evaluate the system under a limited set of operating conditions and do not guarantee the full delivery of the capacity and associated energy of this proposed interconnection request under all operating conditions. NERC Planning and Operating Reliability Criteria allow for the re-dispatch of generating units to resolve projected and actual deficiencies in real time and planning studies. Specifically NERC Category C Contingency Conditions (Bus Fault, Tower Line, N-1-1, and Stuck Breaker scenarios) allow for re-dispatch of generating units to resolve potential reliability deficiencies. For ITO Planning Criteria the re-dispatch of generating units for these contingency conditions is allowed as long as the projected loading does not exceed 100% of a facility Load Dump Rating.

As part of its generation impact analysis ITO routinely evaluates the impact that a proposed new generation resource will have under maximum generation conditions, stress system conditions and import/export system conditions (greater than 20 MW). The results of these studies are discussed in more detail below.

#### **Category B Analysis (Single Contingency):**

- System Normal –
- Critical System Condition (No Surry 230 kV Unit) OR (Possum Point Unit #6 (230kV Unit)
  - No deficiencies identified.

#### **Category C Analysis: (Multiple Facility Contingency)**

- Bus Fault - No deficiencies identified
- Line Stuck Breaker - No deficiencies identified
- Tower Line – No deficiencies identified

As part of its generation impact analysis ITO routinely evaluates the impact that a proposed new generation resource (greater than 20 MW) will have under maximum generation conditions, stress system conditions and import/export system conditions. The results of these studies are discussed in Table A and B below.

Table A: Import Study Results

Import Study Results			
Area	Summer 2020	Summer 2020 with AC1-086	Limiting Element
AEP	2000+	2000+	None
APS	2000+	2000+	None
CPL	2000+	2000+	None
PJM	2000+	2000+	None

Table B: Export Study Results

Export Study Results			
Area	Summer 2020	Summer 2020 with AC1-086	Limiting Element
AEP	2000+	2000+	None
APS	2000+	2000+	None
CPL	2000+	2000+	None
PJM	2000+	2000+	None

ITO's Planning Criteria indicates a need to have approximately 2000 MW of import and export capability. The results of these import and export studies indicate that the proposed AC1-086 (Transfer) will not impact ITO's import or export capability

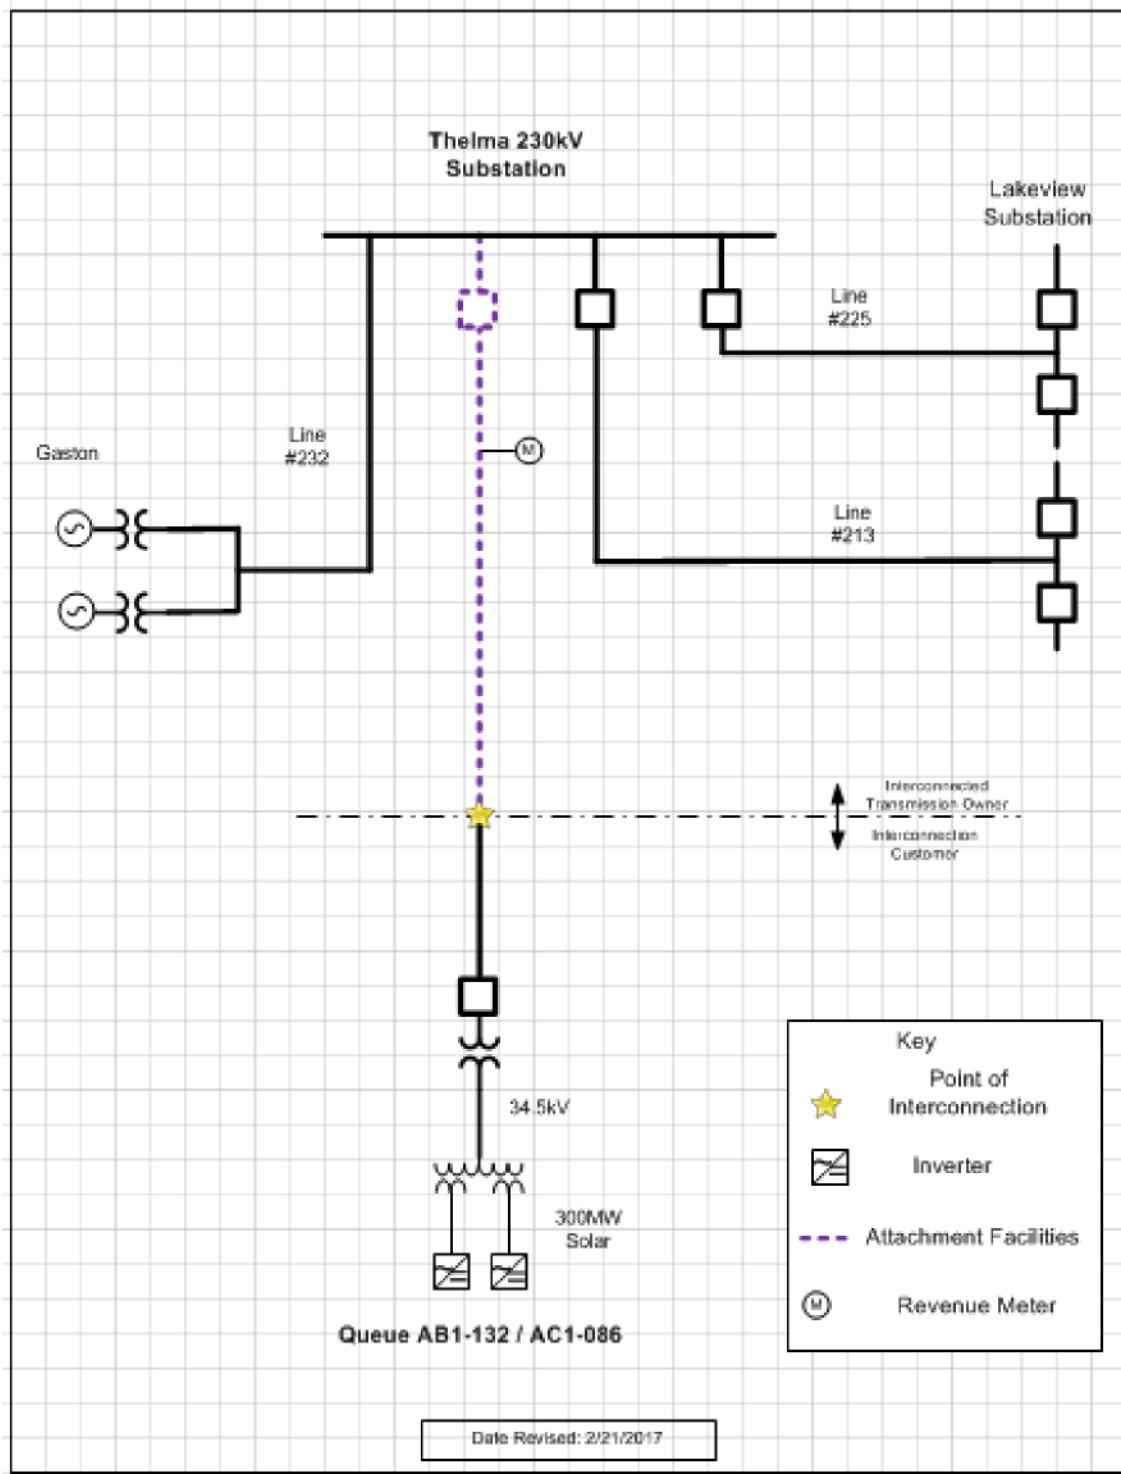

### **Affected System Analysis & Mitigation**

#### **Duke Energy:**

Enter into an Affected System Facilities Study agreement with Duke / Progress Energy (DEP) to determine how to mitigate Battleboro - Rocky Mt.115kV overload. The upgrade will likely be a complete reconductor, probably replacing structures. The estimated cost \$15 million with an estimated duration of 36 months.

## Attachment 1.

### System Configuration

## Appendices

The following appendices contain additional information about each flowgate presented in the body of the report. For each appendix, a description of the flowgate and its contingency was included for convenience. However, the intent of the appendix section is to provide more information on which projects/generators have contributions to the flowgate in question. Although this information is not used "as is" for cost allocation purposes, it can be used to gage other generators impact.

It should be noted the generator contributions presented in the appendices sections are full contributions, whereas in the body of the report, those contributions take into consideration the commercial probability of each project.

## Appendix 1

(DVP - DVP) The 6LAKEVIEW-6CAROLNA 230 kV line (from bus 314583 to bus 314561 ckt 1) loads from 80.68% to 100.83% (AC power flow) of its emergency rating (375 MVA) for the single line contingency outage of 'LN 254\_A'. This project contributes approximately 76.05 MW to the thermal violation.

## Appendix 6

(DVP - DVP) The 6CLUBHSE-6SAPONY 230 kV line (from bus 314563 to bus 314435 ckt 1) loads from 82.78% to 93.84% (AC power flow) of its load dump rating (637 MVA) for the line fault with failed breaker contingency outage of '246T2034\_A'. This project contributes approximately 70.47 MW to the thermal violation.

## Appendix 10

(DVP - DVP) The AB2-100 TAP-6CLUBHSE 230 kV line (from bus 924510 to bus 314563 ckt 1) loads from 95.62% to 133.54% (AC power flow) of its load dump rating (459 MVA) for the line fault with failed breaker contingency outage of '239T2141'. This project contributes approximately 179.8 MW to the thermal violation.

*Generation Interconnection  
Facility Study Report*

*For*

*PJM Generation Interconnection Request  
Queue Position AC1-086*

*Thelma 230kV  
123.7MW Capacity / 180MW Energy*

August, 2020

## General

This Facilities Study has been prepared in accordance with the PJM Open Access Transmission Tariff §207, as well as the Facilities Study Agreement between Gaston Green Acres Solar, LLC, (Interconnection Customer (IC)) and PJM Interconnection, LLC (Transmission Provider (TP)). North Carolina Electric and Power Company is the Interconnected Transmission Owner (ITO) and provided the input to develop this study.

Gaston, NC (Northampton County). The installed facilities will have a total capability of 300 MW with 207.7 MW of this output being recognized by PJM as capacity. This queue request is for an additional 180 MW with 123.7 MW of this output being recognized by PJM as capacity. The proposed in-service date for this project is 12/31/2017. **This study does not imply an ITO commitment to this in-service date.**

## Point of Interconnection

AC1-086 will interconnect with the ITO transmission system will connect into a new bay at Thelma 230kV substation being built to accommodate the AB1-132 project.

## Cost Summary

The AC1-086 project will be responsible for the following costs:

Description	Total Cost
Attachment Facilities	\$ 0
Direct Connection Network Upgrades	\$ 0
Non Direct Connection Network Upgrades	\$ 0
Allocation for New System Upgrades	\$ 2,653,570
Contribution for Previously Identified Upgrades	\$ 23,313
<b>Total Costs</b>	<b>\$ 2,676,883</b>

## A. Transmission Owner Facilities Study Summary

### **1. Description of Project**

Queue AC1-086 is a request to interconnect an additional 180 MW of solar generation to the 120 MW AB1-132 solar facility to be located in Northhampton County, North Carolina. The proposed generating facility will interconnect via a new breaker position at the ITO's Thelma 230kV substation.

Network Upgrade construction is estimated to be 14 - 24 months.

### **2. Amendments to the System Impact Study data or System Impact Study Results**

None

### **3. Interconnection Customer's Milestone Schedule**

- Commercial Operation of AC1-086 November 15, 2022

### **4. Scope of Customer's Work**

IC will build a solar generating facility in Northhampton County, North Carolina. The generating facility will be comprised of solar arrays. AC1-086 consists of 90 x SMA SC 3300-US inverters and 90 x 34.5/0.385 kV 2.0 MVA GSU transformers. The project is connected to the Point of Interconnection (POI) at Thelma 230 kV substation via a bank of 3 x 230/34.5/13.8 kV 36/48/60 MVA transformers.

### **5. Description of Facilities Included in the Facilities Study**

The scope of the project AC1-086 includes necessary network upgrades to reliably connect the generation to the ITO 230 kV transmission network. The project requires the replacement of wave traps at Chickahominy, North Anna, Elmont, and Ladysmith substations. Additionally, the Lakeview substation requires expansion to accommodate a new breaker between the #241 and #2141 circuits and the rebuild of 1.28 of the Lakeview – Carolina 230kV line #2141. Finally, the project requires the uprate of the Battleboro – Rocky Mt. 115kV line, with the work at the Dominion Battleboro terminal detailed here.

## **6. Total Costs of Transmission Owner Facilities included in Facilities Study**

<b>Work Description</b>	<b>Direct</b>		<b>Indirect</b>		<b>Total Cost</b>
	<b>Labor</b>	<b>Material</b>	<b>Labor</b>	<b>Material</b>	
Rebuild Lakeview - Carolina Line #2141 (n6052)	\$389,019	\$176,428	\$61,439	\$18,333	\$645,218
Replace wave trap at Chickahominy Substation (n5464)	\$5,751	\$4,775	\$1,578	\$727	\$12,830
Replace wave trap at North Anna Substation for Midlothian – North Anna 500 kV line #576 (n6055)	\$5,187	\$4,307	\$1,423	\$655	\$11,572
Install back-to-back breaker at Lakeview substation (n6220)	\$1,070,412	\$657,420	\$159,543	\$67,907	\$1,955,282
Replace wave trap on the Elmont - Ladysmith 500kV line (n5483)	\$12,849	\$10,669	\$3,526	\$1,624	\$28,668
Upgrade breaker leads at Battleboro on the line to Rocky Mt. (n6118)	\$10,449	\$8,676	\$2,867	\$1,320	\$23,313
<b>Total Network Upgrades</b>	\$1,493,667	\$862,275	\$230,375	\$90,565	\$2,676,882
<b>Total Project Costs</b>	\$2,720,269	\$1,609,491	\$454,800	\$186,828	\$4,971,388

## **7. Summary of Milestone Schedules for Completion of Work Included in Facilities Study:**

Facilities are estimated to take 14 - 24 months to construct and this is based on the ability to obtain outages to construct and test the proposed facilities.

### Proposed Schedule

- Detailed design: 6-12 months
- Permitting: 6-12 months (Timeline runs concurrent with design)
- Construction 8-12 months

## **B. Transmission Owner Facilities Study Results**

### **1. Attachment Facilities**

None

## **2. Transmission Line – Upgrades**

### **PJM Network Upgrade #n6052 – Rebuild 1.3 miles of the Lakeview – Carolina 230kV line #2141:**

The existing line is approximately 1.4 miles long (1.3 miles of 795 ACSR 45/7 – “Tern” and 0.1 miles of 1033 ACSR 45/7 – “Ortolan”). The line consists of nine (9) V-Series Towers, two (2) tubular steel backbones, one (1) monopole structure, and one (1) switch tower.

Lakeview Substation scope of work includes replacement of two 2000 Amp switches with new 3000 Amp.

#### **Lakeview substation scope:**

1. Install two (2), 230 kV, 3000 Amp, center break disconnect switches
2. Install conductor, connectors, foundations, steel and grounding material as per engineering standards.
3. Remove existing 2000 Amp switches and accessories

#### **REMOVAL:**

1. Remove (1) span (*approximately 0.1 miles*) of 3 phase 1033 ACSR 45/7 – “Ortolan” conductor from Lakeview Substation (Structure 2141/1) to Structure 2141/2.
2. Remove *approximately 1.3 miles* of 3 phase 795 ACSR 45/7 – “Tern” conductor from Structure 2141/2 to Carolina Substation (Structure 2141/13).
3. Remove insulator hardware from Structure 2141/1 to Structure 2141/13 associated with the phase conductor being removed. This will consist of removing approximately:
  - a. (12) suspension insulator assemblies
  - b. (14) idler suspension assemblies
  - c. (2) suspension training insulator assemblies
  - d. (48) dead-end insulator assemblies

#### **INSTALLATION:**

1. Modify (5) existing T0415003 dead end towers to accommodate proposed conductor; modifications included in this estimate are for the installation of dead end conductor assemblies and replacement of failing angle members.
  - a. Tower modifications will need to be completed on Structure 2141/2 (4V Tower + 15' Leg Extension), 2141/5 (4V Tower + 10' Leg Extension), 2141/7 (4V Tower + 15' Leg Extension), and 2141/9 (4V Tower + 15' Leg Extension).
  - b. Install (2) new members on the bottom arm of the structures to reinforce angle members 4V74A.
  - c. Install thirty (30) DE Insulator Assemblies:
  - d. One (1) project specific DE insulator assembly (32.337B) shall be installed on structure 2141/10.

- e. Install fourteen (14) idler suspension assemblies.
2. Modify (4) existing T0412019 suspension towers to accommodate proposed conductor; modifications included in this estimate are for the installation of suspension conductor assemblies.
  - a. Install twelve (12) suspension insulator assemblies.
3. Modify (2) existing backbone structures to accommodate proposed conductor; modifications included in this estimate are for the installation of suspension conductor assemblies.
  - a. Three (3) dead-end insulator assemblies on structure 2141/1.
  - b. Six (6) dead-end insulator assemblies on structure 2141/12.
4. Modify (1) existing monopole structure to accommodate proposed conductor; modifications included in this estimate are for the installation of dead end conductor assemblies.
  - c. Install six (6) dead-end insulator assemblies.
  - d. Install two (2) suspension training insulator assemblies.
5. Modify (1) existing switch tower to accommodate proposed conductor; modifications included in this estimate are for the installation of dead end conductor assemblies.
  - e. Install three (3) dead-end insulator assemblies.
6. Install approximately 1.4 miles of 3-phase 768.2 ACSS/TW/HS-285 – “Maumee” from existing Lakeview Substation (Structure 2141/1) to existing Carolina Substation (Structure 2141/13).

## ESTIMATE ASSUMPTIONS:

1. Line #239, the adjacent circuit on Towers 2141/2 to 2141/7, was modeled using available information to support the analysis of Line #2141 and associated towers. Line #239, other than how it affects Line #2141, is not covered under the scope of project GITAC1034.
2. The PLS-Tower models that were provided by Dominion accurately represent the existing towers. A full model check will need to be performed during detailed design to confirm.
3. The line analysis does not take into account any physical or conditional degradation of the structures.
  - a. A formal conditional analysis of all structures is recommended.
4. No foundation analysis was performed as part of this estimate, and is outside the current scope of this project.
5. Station backbones will have adequate capacity based on GITAC1034 design loads.
6. Analysis results are based on NESC minimum requirements and a structure usage limit of 100%.
7. The LiDAR survey provided is accurate and governs over the structure coordinates that can be found in the SAP Line Data database. Due to the narrow tolerances in the design, it is recommended that additional survey points be taken of the structures (C/L, leg base(s), and conductor attachment points at a minimum) prior to finalization.

## DESIGN NOTES:

1. Per Dominion standards, failing members are to be reinforced not replaced. However, to be conservative both methods were checked.

- a. DAE (3"x3"x0.25") angle type was used to model the reinforcement on the failing member.
  - b. Failing members were replaced with 3"x3"x0.25" and analyzed; towers passed.
2. Section Usage Comparison: Due to terrain limitations within section 2141/2 – 2141/5, the sag of the phase conductor is limited by clearance requirements. Below is a chart comparing the results of the conductor at a MOT of 250°C/482°F, Max Sag and at a MOT of 210°C/410°F, Max Sag.
    - a. The existing conductor (795 ACSR 45/7 – “Tern”) at MOT (90°C/194°F) does not have any additional buffer over the 2017 NESC ground clearance requirement of 22.5'.
    - b. The other sections though-out the line were able to be preliminarily adjusted to limit the amount of section usage, load on the tower members, and usage of insulator assemblies.
  3. Crossing span clearances were checked utilizing provided LiDAR. During final design, it is recommended that the crossing spans are modeled appropriately.

Based on this review it has been recognized that the bottom phase connecting 2141/10 – 2141/11 has a structure clearance violation. The estimate reflects a custom insulator assembly that should be installed to mitigate the violation.

### **3. New Substation/Switchyard Facilities**

None

### **4. Upgrades to Substation / Switchyard Facilities**

#### **PJM Network Upgrade #n6220 – Install a second, back-to-back breaker between existing line positions #241 and #2141 at the Lakeview substation**

The AC1-086 project caused an overload on the Hornertown-Hathaway 230kV line, but it was determined that the contingency causing this overload could be mitigate by adding a second breaker at Lakeview substation.

This project will install a “back-to-back” breaker configuration between the 254 and 2141 lines at Lakeview station.

Note: Currently, the scope and estimate assume DVP standard spread footer foundations. Once the soil information is received and if it is decided to change that to “pile foundations” then DVP team should be informed at the earliest to adjust the project estimate.

#### **Purchase and install substation material:**

1. Approximately 50' x 152' site preparation and grading as required for expansion of the station.
2. Approximately 260 linear FT of 5/8" Chain Link fence to match existing fence.
3. One (1), 230 kV, 3000A, 63kAIC, SF-6 Circuit Breaker.
4. One (1), 230 kV, 3000A, 3-Phase Center Break Gang Operated Switch.
5. Four (4), 230kV, Relay Accuracy CCVTs.
6. Three (3), 180 kV, 144 kV MCOV surge arresters.

7. One (1), 10' x 17'-4" control enclosure expansion.
8. One (1), 125 VDC, 500 Ah Station Battery and 75 Amp Charger (size to be verified during detail engineering).
9. Station Stone as required.
10. Steel structures as required including switch stands, bus supports, and CCVT supports.
11. Foundations as required including control house, equipment, and bus support stands.
12. Conductors, connectors, conduits, control cables, cable trough, and grounding materials as per engineering standards.

**Purchase and install relay material:**

1. One (1), 1510 – 24" Dual SEL-351-7 Transmission Breaker w/ Reclosing Panel
2. One (1), 4510 - SEL-2411 Breaker Annunciator
3. One (1), 4506 – 3 Phase CCVT Potential M.U. Box
4. One (1), 1109 – 24" Dual SEL-587Z Transmission Bus Panel
5. One (1), 4200\_W1 – Bus Differential C.T. M.U. Box
6. One (1), 4507 – 1 Phase CCVT Potential M.U. Box
7. One (1), 7601-EW1 – SEL-547 Voltage Balance Relay
8. One (1), 5609 – Fiber Optic Management Panel
9. One (1), 4526\_A – Circuit Breaker Fiber Optic M.U. Box
10. One (1), SEL 2411 I/O Module

**PJM Network Upgrade #n5464 – Line #557 Chickahominy – Elmont:** Replace wave traps at Chickahominy substation on line #557 to Elmont. Estimated to take 14-16 months to engineer and construct. Costs include the following:

Purchase and install at Chickahominy:

1. Two (2), 500 kV, 5000 amp wave traps
2. Two (2), line tuners, down-leads and conduits
3. Conductor, connectors, steel structures, foundations and grounding material according to current engineering standards.

**PJM Network Upgrade #n6055 – Line #576 Midlothian – North Anna:** Replace wave trap at North Anna substation on the #576 line. Estimated to take 14-16 months to engineer and construct. Costs include the following:

Purchase and install at North Anna:

1. One (1), 500 kV, 5000 amp wave trap
2. One (1), line tuner, down-leads and conduits
3. Conductor, connectors, steel structures, foundations and grounding material according to current engineering standards

**PJM Network Upgrade #n5483 – Line #574 Ladysmith – Elmont:** Replace wave traps at Ladysmith and Elmont substations on the #574 line. Estimated to take 14-16 months to engineer and construct. Costs include the following:

Purchase and install at Ladysmith:

1. Two (2), 500 kV, 5000 amp wave traps
2. Two (2), line tuners, down-leads and conduits
3. Conductor, connectors, steel structures, foundations and grounding material according to current engineering standards.

Purchase and install at Elmont:

1. Two (2), 500 kV, 5000 amp wave traps
2. Two (2), line tuners, down-leads and conduits

Conductor, connectors, steel structures, foundations and grounding material according to current engineering standards.

**PJM Network Upgrade #n6118- Battleboro – Rocky Mt 115kV:** Replace Battleboro substation terminal equipment. Upgrading the breaker leads at Battleboro will bring the rating to 239/239/239 MVA.

Purchase and install at Battleboro substation:

1. Install- 2-795 AAC conductors and connectors as required
2. Remove- existing 1-795 AAC conductors and connectors

## **5. Metering & Communications**

### **PJM Requirements**

The IC will be required to install equipment necessary to provide Revenue Metering (KWH, KVARH) and real time data (KW, KVAR) for IC's generating Resource. See PJM Manuals M-01 and M-14D, and PJM Tariff Section 8 of Attachment O Appendix 2.

### **ITO Requirements**

Metering and SCADA/Communication equipment must meet the requirements outlined in section 3.1.6 Metering and Telecommunications of ITO's Facility Interconnection Connection Requirement NERC Standard FAC-001 which is publically available at [www.nerc.com](http://www.nerc.com).

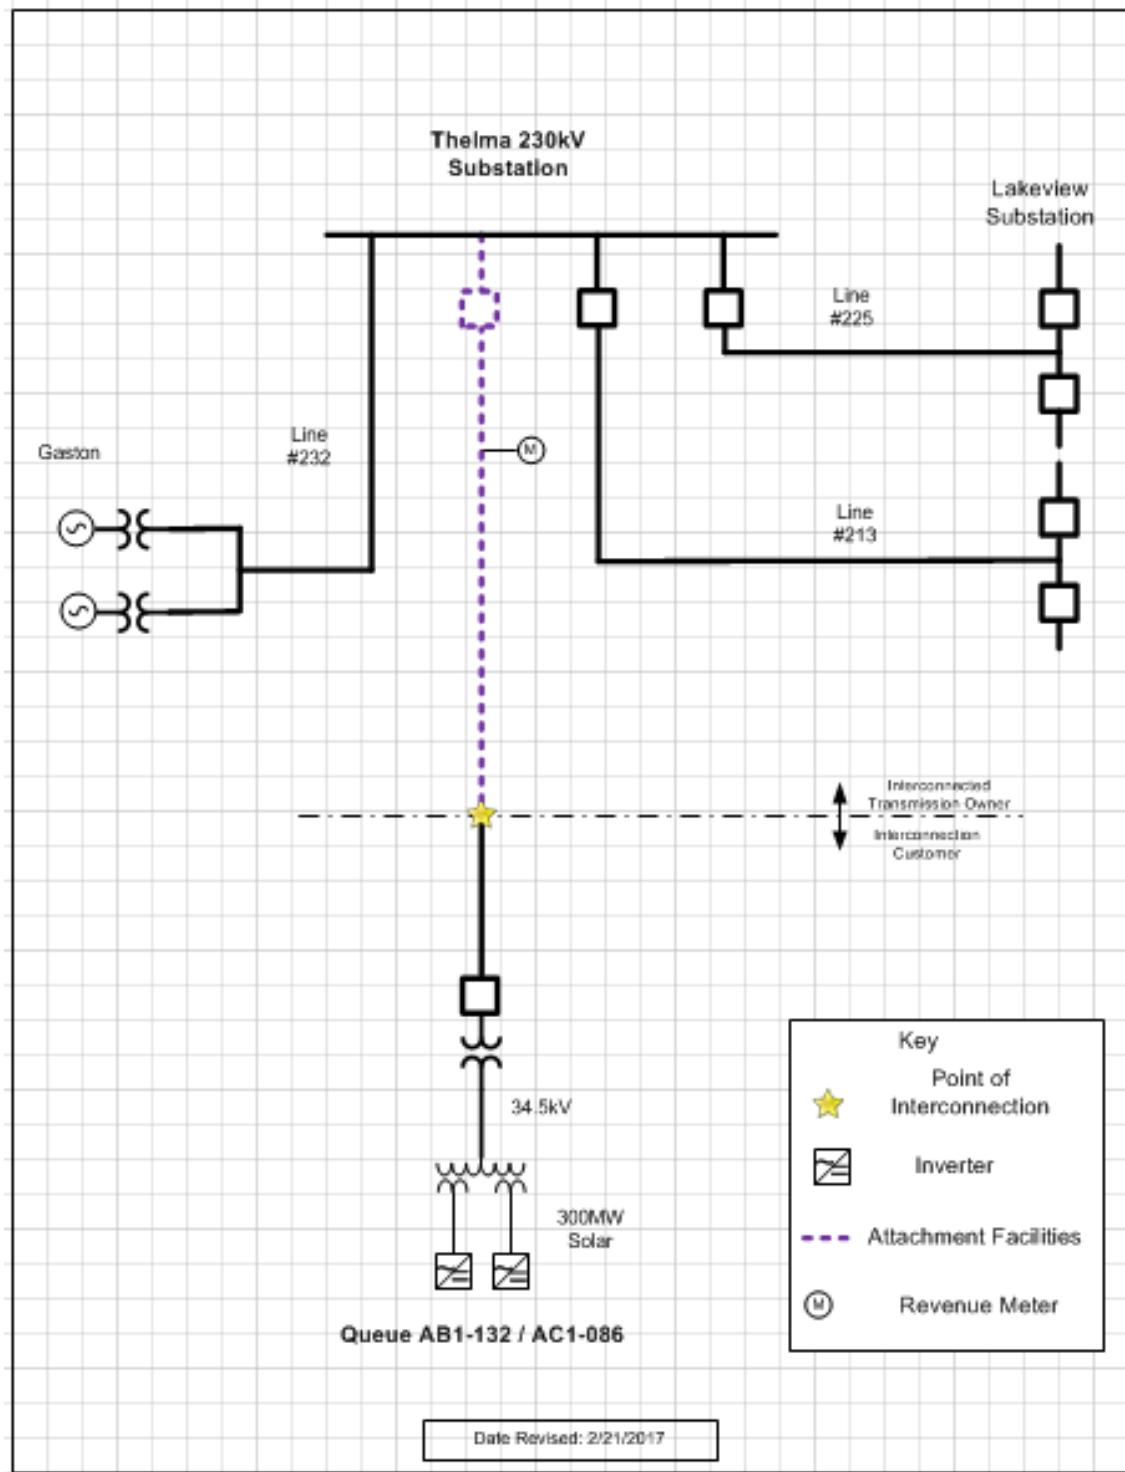

At the IC's expense, the ITO will supply and own at the Point of Interconnection bi-directional revenue metering equipment that will provide the following data:

- a. Hourly compensated MWh received from the Customer Facility to the ITO;
- b. Hourly compensated MVArh received from the Customer Facility to the ITO;
- c. Hourly compensated MWh delivered from the ITO to the Customer Facility; and
- d. Hourly compensated MVArh delivered from the ITO to the Customer Facility.

The IC will supply and own metering equipment that will provide Instantaneous net MW and MVar per unit values in accordance with PJM Manuals M-01 and M-14D, and Sections 8.1 through 8.5 of Appendix 2 to the ISA;

The IC will access revenue meter via wireless transceivers or fiber cabling to meter with RS-485 or Ethernet communication port for dial-up reads. IC must provide revenue and real time data to PJM from Interconnection Customer Market Operations Center per “PJM Telemetry Data Exchange Summary” document available at PJM.com.

123.7 MW Capacity / 180 MW Energy*

Revised May / 2017

## Introduction

This Feasibility Study has been prepared in accordance with the PJM Open Access Transmission Tariff, 36.2, as well as the Feasibility Study Agreement between Gaston Green Acres Solar, LLC, the Interconnection Customer (IC), and PJM Interconnection, LLC (PJM), Transmission Provider (TP). The Interconnected Transmission Owner (ITO) is Virginia Electric and Power Company (VEPCO).

## Preface

The intent of the Feasibility Study is to determine a plan, with high level estimated cost and construction time estimates, to connect the subject generation to the PJM network at a location specified by the IC. The IC may request the interconnection of generation as a capacity resource or as an energy-only resource. As a requirement for interconnection, the IC may be responsible for the cost of constructing: (1) Direct Connections, which are new facilities and/or facilities upgrades needed to connect the generator to the PJM network, and (2) Network Upgrades, which are facility additions, or upgrades to existing facilities, that are needed to maintain the reliability of the PJM system.

In some instances a generator interconnection may not be responsible for 100% of the identified network upgrade cost because other transmission network uses, e.g. another generation interconnection, may also contribute to the need for the same network reinforcement. The possibility of sharing the reinforcement costs with other projects may be identified in the Feasibility Study, but the actual allocation will be deferred until the Impact Study is performed.

The Feasibility Study estimates do not include the feasibility, cost, or time required to obtain property rights and permits for construction of the required facilities. The IC is responsible for the right of way, real estate, and construction permit issues. For properties currently owned by ITO, the costs may be included in the study.

## General

The IC has proposed a solar generating facility located in Gaston, NC (Northampton County). The installed facilities will have a total capability of 300 MW with 207.7 MW of this output being recognized by PJM as capacity. This queue request is for an additional 180 MW with 123.7 MW of this output being recognized by PJM as capacity. The proposed in-service date for this project is 12/31/2017. **This study does not imply an ITO commitment to this in-service date.**

## Point of Interconnection

AC1-086 will interconnect with the ITO transmission system via a tap into Thelma 230kV substation.

## Cost Summary

The AC1-086 project will be responsible for the following costs:

Description	Total Cost
Attachment Facilities	\$0
Direct Connection Network Upgrades	\$0
Non Direct Connection Network Upgrades	\$0
<b>Total Costs</b>	<b>\$0</b>

In addition, the AC1-086 project may be responsible for a contribution to the following costs:

Description	Total Cost
New System Upgrades	\$127,150,000
Previously Identified Upgrades	\$110,430,000
<b>Total Costs</b>	<b>\$237,580,000</b>

Cost allocations for these upgrades will be provided in the System Impact Study Report.

Note: PJM Open Access Transmission Tariff (OATT) section 217.3A outline cost allocation rules. The rules are further clarified in PJM Manual 14A Attachment B. For New System Upgrades, the cost allocation rule differ depending on whether the minimum amount of upgrades to resolve a single reliability criteria violation will cost less than \$5,000,000. For upgrades estimated to cost less than \$5,000,000 the allocation of costs will not occur outside of the Queue in which the need for the Network Upgrade was identified. Cost allocation within the Queue will be contingent each Queue projects Distribution Factor on the overloaded facility. For upgrades estimated to cost \$5,000,000 or greater the allocation of costs will start with the first Queue project to cause the need for the upgrade. Later queue projects will receive cost allocation contingent on their contribution to the violation and are allocated to the queues that have not closed less than 5 years following the execution of the first Interconnection Service Agreement which identifies the need for this upgrade.

## Transmission Owner Scope of Work

### Attachment Facilities

The scope identified in queue AB1-132 is sufficient to accommodate this queue request from an Attachment Facilities and Thelma substation expansion perspective. The single line is shown below in Attachment 1.

### Non-Direct Connection Cost Estimate

#### New System Reinforcement

Reinforcement: Carolina – Lakeview 230 kV line #2141. Uprate/rebuild approximately 1.4 miles of 230 kV Line to increase the line rating by 15% to 360 MVA. It is estimated to take 18-20 months to permit and construct and it is estimated to cost \$3,500,000 to resolve this deficiency.

Reinforcement AB2-100 Tap – Lakeview 230 kV line #254: Rebuild the AB2-100 TAP-Lakeview 230kV line to increase its emergency line rating to a minimum of 460 MVA and its load dump rating to a minimum of 530 MVA. It is estimated to take 44-48 months to permit and construct a Virginia CPCN and potentially a certificate from the NC PUC will most likely be required for this rebuild, the estimated cost is \$41,000,000 to resolve this deficiency.

Reinforcement: Carson - Midlothian 500 kV: replace wave trap at both Carson and Midlothian 500kV Substations. This will increase emergency rating by 31% to 2403 MVA. Estimated cost \$500,000 and it is estimated to 12-16 months to engineer and construct.

Reinforcement: Replace wave trap at Clubhouse substation. Replace the wave trap on the Clubhouse – Saponi 230kV line to increase the emergency rating to 722MVA. It is estimated to take 12-16 months to complete and it is estimated to cost \$150,000 to resolve this deficiency.

Reinforcement: AC1-208 Tap-Hornertown 230kV line #2056: Rebuild approximately 9.7 miles of the AC1-208 TAP-Hornertown 230kV line #2056 to increase its emergency line rating to a minimum of 620 MVA and its load dump rating to a minimum of 730 MVA. Estimated cost is \$25,000,000 and it is estimated to take 30-36 months to engineer, permit and construct.

Reinforcement: AC1-208 Tap – Hathaway 230 kV line # 2056: Rebuild the AC1-208 TAP-Hathaway 230kV line to increase its emergency line rating to a minimum of 620 MVA and its load dump rating to a minimum of 730 MVA. Rebuild / Uprate approximately 19 miles of Line #2056. Estimated cost is \$57,000,000 with an estimated 30-36 months to complete.

#### Contributions to Previously Identified System Reinforcements

Reinforcement: Rebuild of the Chesterfield-Basin 230kV line. It is estimated to take 44 – 48 months to complete and it is estimated to cost \$18,615,000 to resolve the deficiency.

Reinforcement: Battleboro – Rocky Mt 115kV: Replace Battleboro substation terminal equipment. Estimated cost is \$15,000.

Note: Duke/Progress Energy portion of this line will need to be studied under Duke's FERC tariff process.

Reinforcement: Belmont - Ladysmith 500kV: Wreck and rebuild the line for a higher capacity since the overload exceeds the conductor rating. It is estimated to cost \$78,300,000 and it is estimate to take 36-48 months to engineer, permit and construct.

Reinforcement: Rebuild the AB2-100 TAP-Clubhouse 230kV line: Estimated cost \$13,500,000 and it is estimated to take 44-48 months to engineer, permit and construct.

## Interconnection Customer Requirements

ITO's Facility Connection Requirements as posted on PJM's website

<http://www.pjm.com/~/media/planning/plan-standards/private-dominion/facility-connection-requirements1.ashx>

An Interconnection Customer entering the New Services Queue on or after October 1, 2012 with a proposed new Customer Facility that has a Maximum Facility Output equal to or greater than 100 MW shall install and maintain, at its expense, phasor measurement units (PMUs). See Section 8.5.3 of Appendix 2 to the Interconnection Service Agreement as well as section 4.3 of PJM Manual 14D for additional information.

Voltage Ride Through Requirements - The Customer Facility shall be designed to remain in service (not trip) for voltages and times as specified for the Eastern Interconnection in Attachment 1 of NERC Reliability Standard PRC-024-1, and successor Reliability Standards, for both high and low voltage conditions, irrespective of generator size, subject to the permissive trip exceptions established in PRC-024-1 (and successor Reliability Standards).

Frequency Ride Through Requirements - The Customer Facility shall be designed to remain in service (not trip) for frequencies and times as specified in Attachment 2 of NERC Reliability Standard PRC-024-1, and successor Reliability Standards, for both high and low frequency condition, irrespective of generator size, subject to the permissive trip exceptions established in PRC-024-1 (and successor Reliability Standards).

Reactive Power - The Generation Interconnection Customer shall design its non-synchronous Customer Facility with the ability to maintain a power factor of at least 0.95 leading to 0.95 lagging measured at the generator's terminals.

## Revenue Metering and SCADA Requirements

### PJM Requirements

The IC will be required to install equipment necessary to provide Revenue Metering (KWH, KVARH) and real time data (KW, KVAR) for IC's generating Resource. See PJM Manuals M-01 and M-14D, and PJM Tariff Sections 24.1 and 24.2.

## Network Impacts

The Queue Project AC1-086 was evaluated as a 180.0 MW (Capacity 123.7 MW) injection at the Thelma 230kV substation in the ITO area. Project AC1-086 was evaluated for compliance with applicable reliability planning criteria (PJM, NERC, NERC Regional Reliability Councils, and Transmission Owners). Project AC1-086 was studied with a commercial probability of 53%. Potential network impacts were as follows:

### Contingency Descriptions

The following contingencies resulted in overloads:

## Short Circuit

(Summary of impacted circuit breakers)

New circuit breakers found to be over-duty:

None

Contributions to previously identified circuit breakers found to be over-duty:

None

## Contribution to Previously Identified Overloads

(This project contributes to the following contingency overloads, i.e. "Network Impacts", identified for earlier generation or transmission interconnection projects in the PJM Queue)

#	Type	Name	Affected Area	Facility Description	Bus			Power Flow	Loading %		Rating		MW Contribution		Ref

## **Steady-State Voltage Requirements**

(Summary of the VAR requirements based upon the results of the steady-state voltage studies)

To be determined during Impact Study.

## **Stability and Reactive Power Requirement for Low Voltage Ride Through**

(Summary of the VAR requirements based upon the results of the dynamic studies)

To be determined during Impact Study.

## **New System Reinforcements**

(Upgrades required to mitigate reliability criteria violations, i.e. Network Impacts, initially caused by the addition of this project generation)

Violation #	Overloaded Facility	Upgrade Description	Network Upgrade Number	Upgrade Cost
# 1 – 4, 26	6CHARCTY- 6LAKESD 230 kV line	Rebuild 21.32 miles of the Chesterfield - Lakeside 230kV transmission line by 6/1/2020	b2745	\$
# 5 – 11	6MESSER- 6CHARCTY 230 kV line	Rebuild 21.32 miles of the Chesterfield - Lakeside 230kV transmission line by 6/1/2020	b2745	\$
# 12 – 18	6CHSTF B-6MESSER 230 kV line	Rebuild 21.32 miles of the Chesterfield - Lakeside 230kV transmission line by 6/1/2020	b2745	\$
# 19	3BTLEBRO- 3ROCKYMT115T 115 kV line	Upgrade Battleboro terminal equipment	Pending	<b>\$15,000</b>
# 20, 21, 32, 33	6LAKEVIEW- 6CAROLNA 230 kV line	Upate/rebuild approximately 1.4 miles of 230 kV Line to increase the line rating by 15% to 360 MVA. Estimated time: 18-20 months.	Pending	<b>\$3,500,000</b>
# 22	6LAKEVIEW-AB2-100 TAP 230 kV line	Rebuild the AB2-100 TAP-Lakeview 230kV line. Estimated time: 44-48 months.	Pending	<b>\$41,000,000</b>

Violation #	Overloaded Facility	Upgrade Description	Network Upgrade Number	Upgrade Cost
# 23, 34, 35	8CARSON- 8MDLTHAN 500 kV line	Replace wave trap at both Carson and Midlothian 500kV Substations. This will increase emergency rating by 31% to 3424 MVA. Estimated time: 12-16 months.	Pending	\$500,000
# 24, 25, 36, 37	AB2-100 TAP- 6CLUBHSE 230 kV line	Rebuild the AB2-100 TAP-Clubhouse 230kV line. Estimated time: 44-48 months.	Pending	\$13,500,000
# 27 – 30	6CLUBHSE- 6SAPONY 230 kV line	Replace wave trap at Clubhouse Substation. This will increase emergency rating 722 MVA. Estimated time: 12-16 months.	Pending	\$150,000
# 31	6HORNRTN-AC1-208 TAP 230 kV line	Rebuild the AC1-208 TAP-Hornerstown 230kV line to increase its emergency line rating to a minimum of 620 MVA and its load dump rating to a minimum of 730 MVA. Rebuild/Uprate is approximately 9.7 miles of Line #2056. Estimated time: 30-36 months.	Pending	\$25,000,000
# 38	AC1-208 TAP- 6HATHAWAY 230 kV line	Rebuild the AC1-208 TAP-Hathaway 230kV line to increase its emergency line rating to a minimum of 620 MVA and its load dump rating to a minimum of 730 MVA. Estimated time 30-36 months.	Pending	\$57,000,000
<b>Total New Network Upgrades</b>				<b>\$141,165,000</b>

### Contribution to Previously Identified System Reinforcements

(Overloads initially caused by prior Queue positions with additional contribution to overloading by this project. This project may have a % allocation cost responsibility which will be calculated and reported for the Impact Study)

Violation #	Overloaded Facility	Upgrade Description	Network Upgrade Number	Upgrade Cost
# 39 – 41	6CHARCTY- 6LAKESD 230 kV line	Rebuild 21.32 miles of the Chesterfield - Lakeside 230kV transmission line by 6/1/2020	b2745	\$
# 42 – 48	6MESSER- 6CHARCTY 230 kV line	Rebuild 21.32 miles of the Chesterfield - Lakeside 230kV transmission line by 6/1/2020	b2745	\$

Violation #	Overloaded Facility	Upgrade Description	Network Upgrade Number	Upgrade Cost
# 49 – 55	6CHSTF B-6MESSER 230 kV line	Rebuild 21.32 miles of the Chesterfield - Lakeside 230kV transmission line by 6/1/2020	b2745	\$
# 56, 57	6CHSTF B-6BASIN 230 kV line	Rebuild of the Chesterfield-Basin 230kV line. Estimated time: 44-48 months.	Pending	<b>\$18,615,000</b>
# 58	3BTLEBRO-3ROCKYMT115T 115 kV line	Upgrade Battleboro terminal equipment	Pending	<b>\$15,000</b>
# 59, 60	8ELMONT-8LDYSMTH 500 kV line	Wreck and rebuild the line for a higher capacity since the overload exceeds the conductor rating. Estimated time: 36-48 months.	Pending	<b>\$78,300,000</b>
# 61, 62	AB2-100 TAP-6CLUBHSE 230 kV line	Rebuild the AB2-100 TAP-Clubhouse 230kV line. Estimated time: 44-48 months.	Pending	<b>\$13,500,000</b>
<b>Total New Network Upgrades</b>				<b>\$110,430,000</b>

### Potential Congestion due to Local Energy Deliverability

PJM also studied the delivery of the energy portion of this interconnection request. Any problems identified below are likely to result in operational restrictions to the project under study. The IC can proceed with network upgrades to eliminate the operational restriction at their discretion by submitting a Merchant Transmission Interconnection request.

Note: Only the most severely overloaded conditions are listed below. There is no guarantee of full delivery of energy for this project by fixing only the conditions listed in this section. With a Transmission Interconnection Request, a subsequent analysis will be performed which shall study all overload conditions associated with the overloaded element(s) identified.

## Light Load Analysis

Light Load Studies to be conducted during later study phases (as required by PJM Manual 14B).

## ITO Analysis

ITO assessed the impact of the proposed Queue Project #AC1-086 interconnection of a 180 MW Energy (123.7 MW Capacity) injection into the ITO's Transmission System at Thelma 230 kV Substation, for compliance with NERC Reliability Criteria on ITO's Transmission System. The system was assessed using the summer 2020 RTEP case provided to ITO by PJM. When performing a generation analysis, ITO's main analysis will be load flow study results under single contingency (both normal and stressed system conditions). ITO Criteria considers a transmission facility overloaded if it exceeds 94% of its emergency rating under normal and stressed system conditions. A full listing of ITO's Planning Criteria and interconnection requirements can be found in the ITO's Facility Connection Requirements which are publicly available at: <http://www.dom.com>.

The results of these studies evaluate the system under a limited set of operating conditions and do not guarantee the full delivery of the capacity and associated energy of this proposed generation facility under all operating conditions. NERC Planning and Operating Reliability Criteria allow for the re-dispatch of generating units to resolve projected and actual deficiencies in real time and planning studies. Specifically NERC Category C Contingency Conditions (Bus Fault, Tower Line, N-1-1, and Stuck Breaker scenarios) allow for re-dispatch of generating units to resolve potential reliability deficiencies. For ITO's Planning Criteria the re-dispatch of generating units for these contingency conditions is allowed as long as the projected loading does not exceed 100% of a facility Load Dump Rating.

As part of its generation impact analysis, the ITO routinely evaluates the impact that a proposed new generation resource will have under maximum generation conditions, stress system conditions and import/export system conditions (greater than 20 MW). The results of these studies are discussed in more detail below.

#### Category B Analysis (Single Contingency):

1. System Normal – No deficiencies identified
2. Critical System Condition (No Surry 230 kV Unit) – No deficiencies identified

#### Category C Analysis: (Multiple Facility Analysis)

1. Bus Fault - No deficiencies identified
2. Line Stuck Breaker - No deficiencies identified
3. Tower Line – No deficiencies identified

The import and export conditions into and out of the ITO System are evaluated with any new interconnection greater than 20 MW, any new facility that is interconnected with the ITO System should not significantly decrement FCITC between utilities. These studies will be performed during the System Impact Study.

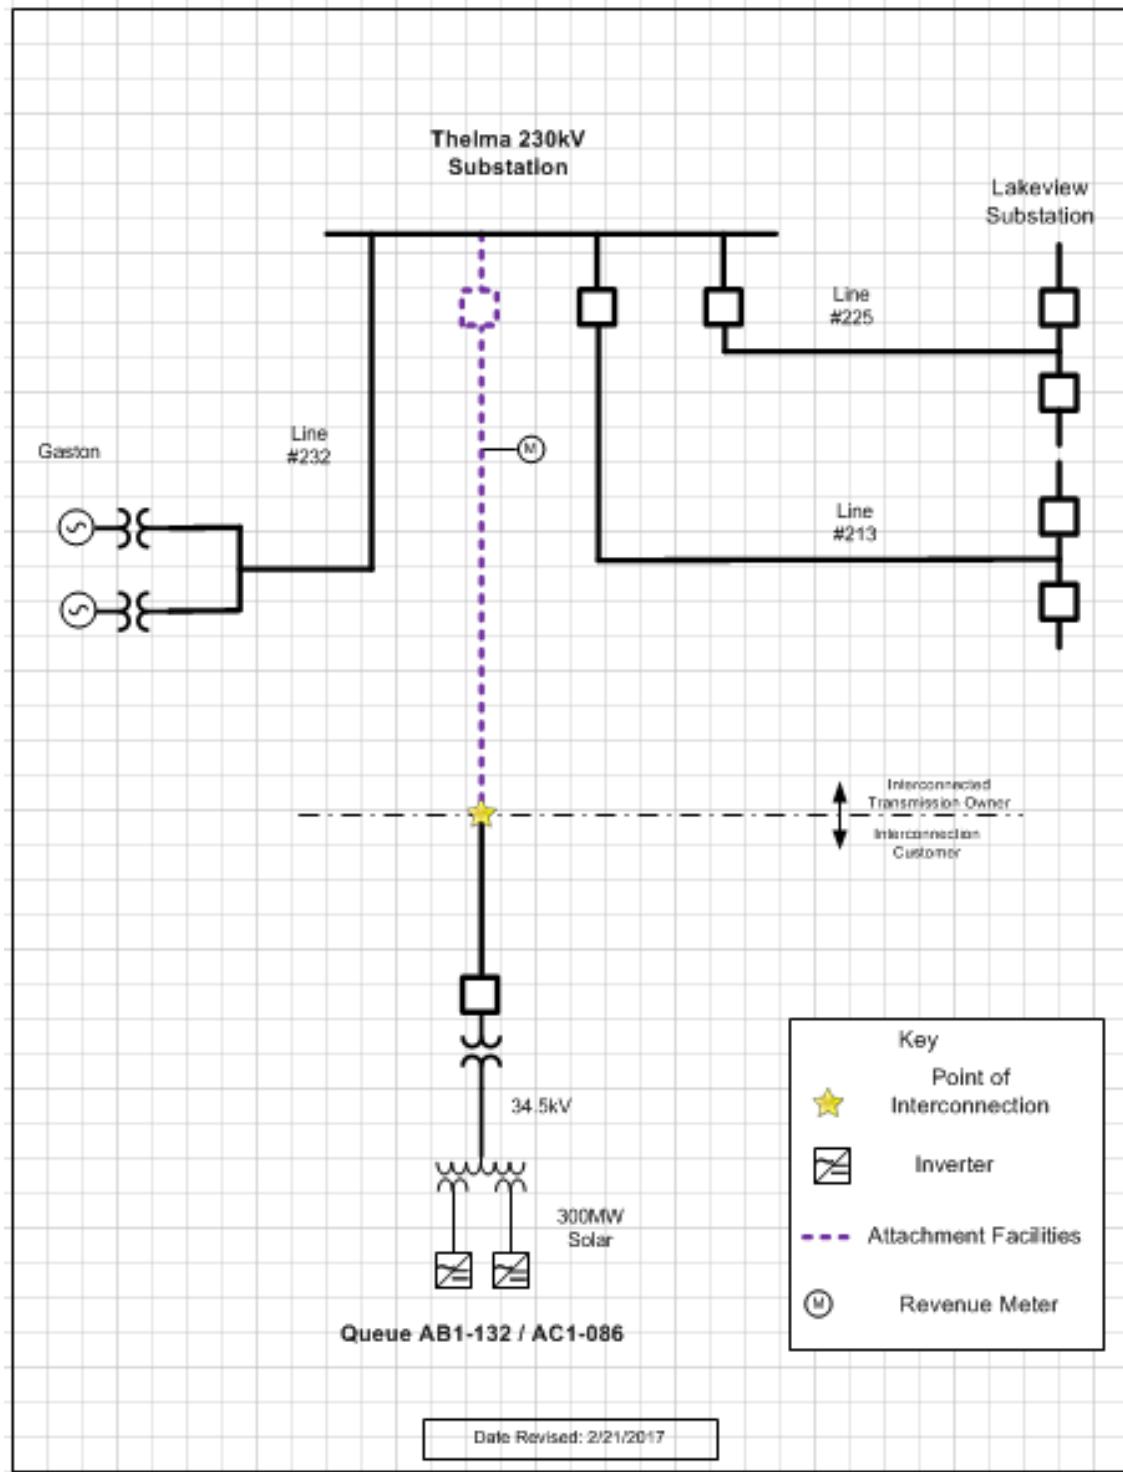

### **Affected System Analysis & Mitigation**

#### **Duke, Progress & TVA Impacts:**

Duke Carolina, Progress, & TVA Impacts to be determined during later study phases (as applicable).

## Attachment 1.

### System Configuration

### *Flowgate Appendices*

## Appendices

The following appendices contain additional information about each flowgate presented in the body of the report. For each appendix, a description of the flowgate and its contingency was included for convenience. However, the intent of the appendix section is to provide more information on which projects/generators have contributions to the flowgate in question. Although this information is not used "as is" for cost allocation purposes, it can be used to gage other generators impact. When a flowgate is identified in multiple analysis the appendix is presented for only the analysis with the greatest overload.

***It should be noted the generator contributions presented in the appendices sections are full contributions, whereas in the body of the report, those contributions take into consideration the commercial probability of each project.***

## Appendix 1

(DVP - DVP) The 6LAKEVIEW-AB2-100 TAP 230 kV line (from bus 314583 to bus 924510 ckt 1) loads from 81.15% to 94.92% (**DC power flow**) of its emergency rating (375 MVA) for the single line contingency outage of 'LN 2012'. This project contributes approximately 51.64 MW to the thermal violation.

## Appendix 7

(DVP - DVP) The 6CHARCTY-6LAKESD 230 kV line (from bus 314225 to bus 314227 ckt 1) loads from 126.84% to 128.09% (**DC power flow**) of its load dump rating (459 MVA) for the tower line contingency outage of 'LN 208-259'. This project contributes approximately 12.76 MW to the thermal violation.

## Appendix 10

(DVP - DVP) The 6CHSTF B-6BASIN 230 kV line (from bus 314287 to bus 314276 ckt 1) loads from 117.04% to 118.07% (**DC power flow**) of its emergency rating (449 MVA) for the single line contingency outage of 'LN 563'. This project contributes approximately 10.3 MW to the thermal violation.

CONTINGENCY 'LN 563'

## Appendix 11

(DVP - CPLE) The 3BTLEBRO-3ROCKYMT115T 115 kV line (from bus 314554 to bus 304223 ckt 1) loads from 141.55% to 154.3% (**DC power flow**) of its emergency rating (164 MVA) for the tower line contingency outage of 'LN 2058-2181'. This project contributes approximately 20.91 MW to the thermal violation.

## Appendix 12

(DVP - DVP) The 8ELMONT-8LDYSMTH 500 kV line (from bus 314908 to bus 314911 ckt 1) loads from 111.72% to 112.32% (**DC power flow**) of its emergency rating (2442 MVA) for the single line contingency outage of 'LN 576'. This project contributes approximately 32.75 MW to the thermal violation.

### CONTINGENCY 'LN 576'

## Appendix 13

(DVP - DVP) The AB2-100 TAP-6CLUBHSE 230 kV line (from bus 924510 to bus 314563 ckt 1) loads from 112.94% to 152.11% (**DC power flow**) of its load dump rating (459 MVA) for the line fault with failed breaker contingency outage of '239T2141'. This project contributes approximately 179.8 MW to the thermal violation.

# Generator Interconnection Affected System Study Report

PJM Interconnection Cluster AC1

May 6, 2020  
Duke Energy Progress  
Transmission Department

## PURPOSE

The purpose of this study was to determine under what conditions the DEP transmission system can accommodate PJM's interconnection cluster AC1. Cluster AC1 includes generation throughout the PJM interconnection, but only those with an impact on the DEP system were included in this study. The size and in-service dates of the projects vary. The following PJM queue requests are included in this analysis:

AC1-034  
AC1-086  
AC1-098/099  
AC1-189  
AC1-208

## ASSUMPTIONS

The following affected system study results are from a PJM power-flow model that reflects specific conditions of the system at points in time consistent with the generator interconnection requests being evaluated. The cases include the most recent information for load, generation additions, transmission additions, interchange, and other pertinent data necessary for analysis. Future years may include transmission, generation, and interchange modifications that are not budgeted for and for which no firm commitments have been made. Further, DEP retains the right to make modifications to power-flow cases as needed if additional information is available or if specific scenarios necessitate changes. For the systems surrounding the study area, data is based on the ERAG MMWG model. The suitability of the model for use by others is the sole responsibility of the user. Prior queued generator interconnection requests were considered in this analysis.

The results of this analysis are based on the Interconnection Customer's queue requests including generation equipment data provided. If the facilities' technical data or interconnection points to the transmission system change, the results of this analysis may need to be reevaluated.

## RESULTS

### Power Flow Analysis Results

Facilities that may require upgrade within the first three to five years following the in-service date are identified. Based on projected load growth on the DEP transmission system, facilities of concern are those with post-contingency loadings of 95% or greater of their thermal rating and low voltage of 0.92 pu and below, for the requested in-service year. The identification of these facilities is crucial due to the construction lead times necessary for certain system upgrades. This process will ensure that appropriate focus is given to these problem areas to investigate whether construction of upgrade projects is achievable to accommodate the requested interconnection service.

Contingency analysis study results show that interconnection of these generation facilities result in the following thermal issue on the DEP system. Based on study results for 2020 summer, Table 1 shows thermal facility loadings:

**Table 1: Power Flow Thermal Results**

Transmission Facility	Loading %	Contingency
Rocky Mount – Battleboro (DVP) 115 kV Line	160	Rocky Mount-Hathaway (DVP) Double Circuit 230 kV Lines

## Estimate of Resolutions for Power Flow Impacts

The DEP Rocky Mount-Battleboro 115 kV Line will need to be reconducted with 1590 ACSR conductor or equivalent. All ancillary equipment, including any breakers, wave traps, and CT ratios at both ends of the line will need to be uprated to 2000A or greater.

### Reconductor

*Description:* Reconductor/rebuild 8.5 miles of the DEP Rocky Mount-Battleboro 115 kV Line to 1590 ACSR conductor or equivalent  
*Estimated Cost:* \$21,980,250 (DEP cost only)

### Line Equipment upgrades

*Description:* Upgrade any ancillary line equipment at both the DEP and DVP ends of the line to 2000A or greater to enable the full conductor rating.  
*Estimated Cost:* \$658,377 (DEP cost only)

NC Utility Tax(2.5%): \$565,966

Total Power-flow Cost Estimate: **\$23,204,593 (DEP cost only)**

*Estimated Schedule:* 12/31/2022

## SUMMARY

This Generator Interconnection Affected System Study assessed the impact on the Duke Energy Progress system of new generation facilities interconnecting to the Dominion transmission system as part of the PJM AC1 cluster. Power flow analysis found an overloading issue that must be mitigated. A full reconductor/rebuild of the Rocky Mount-Battleboro 115 kV Line will be necessary. Estimates are that the Rocky Mount-Battleboro 115 kV Line can be upgraded by December 31, 2022 if a written agreement to proceed is obtained by July 4, 2020.

Power-flow	\$23,204,593
Stability	\$0
Short Circuit	\$0
<u>Interconnection</u>	<u>\$0</u>
Total Estimate	\$23,204,593
