## **I. Introduction**

1 **Q. PLEASE STATE YOUR FULL NAME AND BUSINESS ADDRESS.**

2 A. My name is Dennis Stephens. My business address is 1153 Bergen Parkway, Ste  
3 130, Evergreen, Colorado, 80439.

4 **Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?**

5 A. I am an independent consultant. I collaborate frequently with Paul Alvarez, who  
6 is also testifying in this docket, and his firm, the Wired Group, on behalf of clients  
7 in distribution utility regulatory proceedings on matters of electric distribution  
8 grid planning, investment, operations, reliability, and distributed energy resource  
9 accommodation.

10 **Q. PLEASE DESCRIBE YOUR PROFESSIONAL AND EDUCATIONAL**  
11 **BACKGROUND.**

12 A: After graduating from the University of Missouri with a bachelor's degree in  
13 Electrical Engineering, I began work for Xcel Energy (then Public Service  
14 Company of Colorado) as an electrical engineer in distribution operations. In a  
15 series of electrical engineering and management roles of increasing responsibility,  
16 I gained experience in distribution planning, operations, and asset management,  
17 and the innovative use of technology to assist with these functions. Positions I  
18 have held over the years have included Director, Electric and Gas Operations for  
19 the City and County of Denver Colorado; Director, Asset Strategy; and Director,  
20 Innovation and Smart Grid Investments.

21 In 2007, I was asked to lead parts of Xcel Energy's SmartGridCity™  
22 demonstration project in Boulder, Colorado, the first of its kind at the time,

1 covering 46,000 ratepayers. I developed the technical foundations for the project,  
2 including the development of all concepts presented to the Xcel Energy Executive  
3 Committee for project approval, and including the negotiations with technology  
4 vendors on their contributions to the project. As Director of Utility Innovations  
5 for Xcel Energy, I also worked with many software providers, including ABB,  
6 IBM, and Siemens, helping them develop their distribution automation ideas into  
7 practical software applications of value to grid owner/operators. I retired from  
8 Xcel Energy in 2011, and now consult for the Wired Group part-time.

9 **Q HAVE YOU TESTIFIED PREVIOUSLY BEFORE THE NORTH**  
10 **CAROLINA UTILITIES COMMISSION?**

11 A. Yes. I submitted testimony on Duke Energy's Grid Improvement Plan, covering  
12 both Duke Energy Carolinas ("DEC") and Duke Energy Progress ("DEP"), in  
13 Docket No. E-7, Sub 1214. Because the Grid Improvement Plan covers both  
14 Companies, my testimony herein is virtually identical to that testimony.

15 **Q. HAVE YOU TESTIFIED BEFORE OTHER STATE UTILITY**  
16 **REGULATORY COMMISSIONS?**

17 A. Yes. I have testified jointly with Witness Alvarez in three rate cases before the  
18 California Public Utilities Commission. I testified regarding the appropriateness  
19 of multi-billion-dollar grid modernization proposals by Southern California  
20 Edison and Pacific Gas and Electric. I also critiqued Indianapolis Power and  
21 Light's \$1.2 billion Grid Improvement Plan before the Indiana Utility Regulatory  
22 Commission and testified jointly with Witness Alvarez in cases regarding  
23 distribution grid planning process development in Michigan and New Hampshire.  
24 I have also supported the Wired Group in client projects not involving testimony,

1 including one in South Carolina regarding Duke Energy's Grid Modernization  
2 Plan,<sup>1</sup> and a similar paper on Dominion's Grid Transformation Plan.<sup>2</sup> (I note the  
3 Virginia SCC largely rejected Dominion's Grid Transformation Plan.)<sup>3</sup> My full  
4 CV is provided as Stephens Exhibit 1 to this testimony.

5 **Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?**

6 A. I am testifying on behalf of the North Carolina Justice Center, the North Carolina  
7 Housing Coalition, the Natural Resources Defense Council, and the Southern  
8 Alliance for Clean Energy (collectively, "NCJC et al.") and the North Carolina  
9 Sustainable Energy Association ("NCSEA"). My testimony critiques the Grid  
10 Improvement Plan ("GIP") and associated cost-benefit analyses DEP presents in  
11 this case.<sup>4</sup>

**II. Preview and Recommendations**

12 **Q. PLEASE PROVIDE A PREVIEW OF YOUR TESTIMONY AND**  
13 **RECOMMENDATIONS IN THIS PROCEEDING.**

14 A. My testimony begins with context, describing typical distribution planning  
15 processes utilities have employed for decades. I also provide historical data  
16 indicating that Duke Energy's reliability has deteriorated markedly in recent years  
17 despite grid investment growth far exceeding peak demand growth. My

<sup>1</sup> Alvarez P and Stephens D. *Modernizing The Grid in the Public Interest: Getting a Smarter Grid at the Least Cost for South Carolina Customers*. Paper prepared for GridLab. Jan. 31, 2019.

<sup>2</sup> Alvarez P and Stephens D. *Modernizing the Grid in the Public Interest: A Guide for Virginia Stakeholders*. October 5, 2018.

<sup>3</sup> Final Order RE: Petition of Virginia Electric and Power Company. Virginia State Corporation Commission Docket No. PUR-2018-00100 (January 17, 2019).

<sup>4</sup> DEC and DEP have each filed the GIP in their concurrent respective rate cases. Since the GIP is, for the most part, common to both DEP and DEC and incorporates territory-overlapping programs and proposed investments, I will refer to DEC and DEP, collectively, as "Duke Energy" throughout my testimony in reference to the GIP proposal.

1 testimony then identifies multiple deficiencies in the design, technical  
2 justification, and cost-effectiveness of many GIP programs, and identifies a  
3 complete lack of justification for others. These illustrate the opportunity for a  
4 transparent, stakeholder-engaged distribution planning and capital budgeting  
5 process to improve the value delivered to North Carolina ratepayers,  
6 communities, and the environment by distribution grid investments.

7 **Q. WHAT IS YOUR PRIMARY RECOMMENDATION TO THE**  
8 **COMMISSION?**

9 A. My primary recommendation is for the Commission to reject Duke Energy's GIP  
10 and establish a proceeding to develop such a process for use in developing future  
11 distribution plans and capital budgets that better align the needs of stakeholders  
12 and utilities. Witness Alvarez's testimony provides an outline for such a process,  
13 and additional justification for the same recommendation.

14 **Q. IN THE EVENT THAT THE COMMISSION DOES NOT ACCEPT YOUR**  
15 **PRIMARY RECOMMENDATION, DO YOU HAVE A SECONDARY**  
16 **RECOMMENDATION?**

17 A. Yes. My testimony provides a secondary, alternative recommendation, wherein  
18 the Commission evaluates each GIP program independently. This part of my  
19 testimony examines individual GIP programs and sub-components in detail,  
20 providing valuable, objective information regarding the design and justification  
21 (or lack thereof) for each GIP program. I categorize GIP programs into groups of  
22 similar merit. In the event the Commission rejects my primary recommendation, I  
23 hope these "merit groupings" will serve as a set of secondary recommendations to

inform Commission decisions. The merit groups and programs are presented in Table 1, summarized below, and explained in detail in my testimony.

*Table 1: Summary of GIP Programs/Sub-components By Merit*

Program/Subcomponent	Capital \$ per Oliver Exh. 10 (in millions)	Suggested Adjustments	Capital \$ per NCJC/NCSEA If GIP Not Rejected
Merits Approval w/Conditions	\$ 374.16	\$ -	\$ 374.16
Integrated Volt/VAr Control	\$ 216.66	\$ -	\$ 216.66
Transmission H&R-- Flood & Animal Mitigation Components	\$ 13.18	\$ -	\$ 13.18
Long Duration Interruption/High Impact Sites	\$ 27.10	\$ -	\$ 27.10
Enterprise Applications/ISOP Software/DER Software	\$ 41.94	\$ -	\$ 41.94
Cyber and Physical Security, excluding substation physical	\$ 23.04	\$ -	\$ 23.04
Enterprise Comm's excluding new data and voice networks	\$ 52.24	\$ -	\$ 52.24
Merits Approval w/Material Modifications & Conditions	\$ 843.05	\$ (336.80)	\$ 506.25
Self-Optimizing Grid/Advanced Dist Mgmt System	\$ 722.48	\$ (336.80)	\$ 385.67
Transmission H&R (DER Capacity Upgrades ONLY)	\$ 120.57	\$ -	\$ 120.57
Merits Rejection	\$ 659.95	\$ (659.95)	\$ -
Targeted Undergrounding	\$ 114.54	\$ (114.54)	\$ -
Distribution Transformer Retrofit	\$ 118.02	\$ (118.02)	\$ -
Transformer Bank Replacement	\$ 116.39	\$ (116.39)	\$ -
Oil-Filled Breaker Replacement	\$ 200.29	\$ (200.29)	\$ -
Substation Perimeter Security	\$ 110.71	\$ (110.71)	\$ -
Merits Rejection Pending Further Evaluation	\$ 440.27	\$ (440.27)	\$ -
Enterprise Comm's, new data & voice (tech/econ make/buy analyses)	\$ 159.58	\$ (159.58)	\$ -
Distribution Automation (benefit-cost analysis)	\$ 194.29	\$ (194.29)	\$ -
Transmission System Intelligence (benefit-cost analysis)	\$ 86.41	\$ (86.41)	\$ -
GIP Components Being Considered in Other Dockets	\$ 192.48	\$ (192.48)	\$ -
Energy Storage (NCUC #E-100, Sub 164)	\$ 129.00	\$ (129.00)	\$ -
Electric Transportation (NCUC #E-2 Sub 1197 & E-7 Sub 1195)	\$ 63.48	\$ (63.48)	\$ -
TOTALS	\$ 2,509.92	\$ (1,629.51)	\$ 880.41

Programs and sub-components that merit approval with conditions. Some GIP programs merit approval with conditions. The mix of spending between and even within the programs and sub-components would likely be optimized through the use of a transparent, stakeholder-engaged distribution planning and capital

1 budgeting process. Programs that I believe merit approval with conditions,  
2 amounting to \$374 million in capital, include (1) the Integrated Volt-VAR  
3 Control (“IVVC”) program; (2) the flood and animal mitigation components of  
4 the Transmission Hardening and Restoration program; (3) the Long Duration  
5 Interruption/High Impact Sites program; (4) foundational software, including  
6 Enterprise Applications, Integrated System Operations Planning (“ISOP”), and  
7 Distributed Energy Resource (“DER”) dispatch; (5) Cybersecurity (excluding  
8 substation physical security); and (6) Enterprise Communications (excluding  
9 mission critical voice and data network investments pending further evaluation, as  
10 described).

11 Self-Optimizing Grid. This program merits approval with conditions, but  
12 at a reduced investment level (from \$722 million to \$385 million) so as to focus  
13 the spending on the 50% of circuits and segments of highest priority/greatest  
14 benefit. This will improve the benefit-to-cost ratio of self-optimizing grid  
15 program capital and reduce the risk that the program is applied to circuits for  
16 which costs exceed benefits. Reliability performance can be measured so that  
17 informed consideration can be given to program expansion in the future. If the  
18 Commission approves this program, I also recommend it keep a very close eye on  
19 the \$48 million advanced distribution management system deployment.

20 Transmission Hardening and Resilience (not related to flood or animal  
21 mitigation). My testimony explains why this capital budget (\$120 million) merits  
22 approval with conditions but modifies the goal and design of the program  
23 completely. As proposed, the program makes progress towards greater

1 accommodation of DER, but does not actually increase the capacity of Duke  
2 Energy's grid to accommodate more DER by a single watt. Instead, I recommend  
3 the portions of the GIP transmission hardening and restoration budget not targeted  
4 to flooding and animal risk mitigation be focused on increasing the capacity of  
5 Duke Energy's grid to accommodate more DER. These include (1) upgrading  
6 DEC's 44kV lines to 100kV lines; and/or (2) increasing the number of DEC  
7 substations served by 44kV lines; and/or (3) reducing any DER bottlenecks in  
8 DEP's transmission grid. The value of involving stakeholders in the optimization  
9 of the transmission hardening and restoration budget to maximize DER  
10 accommodation per dollar of GIP capital across the DEC and DEP transmission  
11 system is clear.

12 Programs to Reject Due to Lack of Cost-Effectiveness/Compliance with  
13 Standard Practice. My testimony explains why these programs are not cost  
14 effective and are not standard practice in the industry. Totalling \$660 million,  
15 they include (1) targeted undergrounding; (2) distribution transformer retrofit; (3)  
16 transformer bank replacement; (4) oil-filled breaker replacement; and (5) physical  
17 substation security.

18 Programs to Reject Pending Further Evaluation. My testimony explains  
19 that insufficient information is available to make a recommendation on these  
20 programs. Witness Alvarez's testimony explains why a technical and economic  
21 make vs. buy analysis, considering recent and emerging public telecom network  
22 capabilities, is required before a recommendation regarding \$160 million in new  
23 voice and data communications network investments can be determined. I also

1 note that no benefit-cost analysis has been completed on distribution automation  
2 and transmission system intelligence programs and recommend that the  
3 Commission reject them until Duke Energy completes these analyses.

4 **Q. PLEASE DESCRIBE THE CONDITIONS ON APPROVAL THAT YOU**  
5 **RECOMMEND.**

6 A. I recommend the Commission apply three conditions for any GIP programs it  
7 approves. The first condition is ongoing performance measurement against pre-  
8 GIP baselines. I point specifically to measuring annual average voltage  
9 reductions from the IVVC program, as well as reliability improvements from the  
10 Self-Optimizing Grid program, but I believe a policy of performance  
11 measurement is important for any extraordinary distribution investments the  
12 Commission approves. There is no other way to determine if the program benefit  
13 claims Duke Energy makes are reasonable, or if the approved programs should be  
14 expanded or curtailed in the future.

15 The second of these conditions involve cost caps and associated operating  
16 audits. As indicated in Witness Alvarez's testimony, Duke Energy never actually  
17 provides a GIP capital budget limit or estimate of the cost to ratepayers. I  
18 recommend the Commission establish capital cost caps for every GIP program or  
19 sub-component it approves, as well as specifications for the program-specific  
20 extents of capabilities it expects to be operational within the cost cap (generally,  
21 as specified by Duke Energy in its GIP program descriptions and/or cost-benefit  
22 analyses). Without cost caps or extent specifications (circuits, line miles,  
23 substations, etc.), the Commission has no way of knowing whether promised

1 capabilities or extents are operating for the proposed costs. Program audits will  
2 be needed to verify that capabilities have been implemented to the extent  
3 promised for the costs estimated. The Commission may also wish to act on my  
4 recommendation regarding financial consequences for exceeding program cost  
5 caps or failing to deliver the promised extent of a program's capability within a  
6 cost cap. As proposed, ratepayers bear all of these risks, and shareholders none of  
7 these risks. Cost sharing between ratepayers and shareholders for cost overruns  
8 or extent shortfalls would hold Duke Energy accountable for cost estimate  
9 accuracy and program implementation success.

10 The third condition relates to capital DEP spent on GIP assets placed into  
11 service during the test year. For the GIP programs the Commission approves, I  
12 recommend capital spent on GIP assets placed into service during the test year be  
13 included in program cost caps as a condition of approval. For the GIP programs  
14 the Commission rejects – and in particular, those programs it rejects due to a lack  
15 of cost-effectiveness and industry standard practice compliance – I recommend  
16 recovery of and on capital spent on such assets placed into service during the test  
17 year be denied.

18 **Q. DO YOU HAVE OTHER RECOMMENDATIONS FOR THE**  
19 **COMMISSION REGARDING THE GIP?**

20 A. Yes. My testimony indicates that many GIP programs are not cost-effective, and  
21 outside standard industry practice, and that Duke Energy provides no economic  
22 justification at all for other GIP programs. Witness Alvarez's testimony indicates  
23 that GIP program costs to ratepayers and communities are dramatically

1 understated and ratepayer benefits dramatically overstated. In this rate case Duke  
2 Energy proposes deferral accounting treatment to address “regulatory lag” for GIP  
3 costs. This serves to increase the likelihood that Duke Energy will earn or exceed  
4 its authorized rate of return on equity, thereby increasing Duke Energy’s already-  
5 adequate incentive to invest in its grid. I concur with Witness Alvarez’s  
6 conclusion that deferral accounting treatment leads to excessive capital spending  
7 on sub-optimal projects, and with his recommendation that deferral accounting for  
8 GIP investments be rejected on that basis.

### **III. Historical Context**

9 **Q. BEFORE PROCEEDING, PLEASE PROVIDE THE HISTORICAL**  
10 **CONTEXT YOU MENTIONED.**

11 A. Since the introduction of alternating current and the power grid concept in the  
12 early 20th century, utilities have taken a simple approach to grid planning. They  
13 build systems to deliver power from an energy source to a consumer. As the  
14 number, locations, and energy use of the consumers grew, utilities methodically  
15 planned and implemented expansions in grids’ geographic extents and energy  
16 capacities over time. As grids developed, grid reliability and safety issues arose.  
17 A solution was devised, which was the use of substations as hubs for protection  
18 and control to deliver safe and reliable electricity to consumers via “spokes,”  
19 which engineers know as circuits. Early grids were initially protected by fuses,  
20 which later evolved into oil-filled circuit breakers in conjunction with analog  
21 electromechanical relays, reclosers, and various devices to reduce circuits into  
22 individualized sections. These protection systems were designed to de-energize

1 small sections of the grid, isolating faults and other problems to prevent damage  
2 to the rest of the grid, and became the standard for grid protection and control.

3 **Q. HOW IS THIS HISTORICAL CONTEXT RELEVANT TO THIS**  
4 **PROCEEDING?**

5 A. For over a century, utilities have successfully incorporated new technologies,  
6 along with new operating practices, to deliver safe, reliable, and low-cost electric  
7 distribution services under conditions of growing loads and increasing ratepayer  
8 expectations. Utilities have done so using a methodical, common-sense approach  
9 to distribution planning that focuses on a single question: do the benefits (i.e.,  
10 reduction in risk of an adverse event such as a service interruption) justify the  
11 costs? Over the course of many decades, a generally-accepted distribution  
12 planning process, as well as a generally-accepted set of standard industry  
13 practices, has arisen. Both the planning process and the standard practices are the  
14 result of thousands of electrical engineers like me, asking this question thousands  
15 of times while working on thousands of distribution circuits.

16 **Q. ARE YOU SUGGESTING THAT THERE IS NO NEED FOR**  
17 **INNOVATION IN DISTRIBUTION PLANNING AND INVESTMENT?**

18 A. Not at all. While generally-accepted distribution planning processes and standard  
19 practices have proven their value and should not be abandoned, this does not  
20 mean they have not undergone, or should not undergo, adjustments from time to  
21 time. Duke Energy Witness Oliver identifies megatrends prompting the  
22 development of the GIP.<sup>5</sup> I condense these down into two that require at least

---

<sup>5</sup> *Direct Testimony of Jay W. Oliver*, (“*Oliver Direct*”), Exhibit 2, p. 2 (September 30, 2019).

1       some adaptation of utilities' historical distribution planning processes: (1) the  
2       increasing penetration of distributed energy resources ("DER"), which can lead to  
3       bi-directional power flow in high-enough capacities (towards the substation as  
4       well as away from it); and (2) increased frequency of severe weather events.  
5       However, I do not agree that these trends require a departure from best utility  
6       practices in distribution planning. Changes in DER adoption and weather severity  
7       simply require the application of new technology and practices on an as-needed  
8       basis, justified through the technical reviews and cost-risk evaluations that have  
9       always been a part of utility distribution planning processes. Stakeholders can  
10      and should be part of these reviews, evaluations, and decisions. I also do not  
11      agree that large investments in grid modernization require a change in the  
12      methods by which utilities are compensated.

13   **Q.   WHAT RELEVANCE DO YOUR CONTEXTUAL OBSERVATIONS HAVE**  
14   **TO DUKE ENERGY'S GIP?**

15   A.   Duke Energy's GIP exhibits characteristics common to such plans issued by US  
16       investor-owned utilities in recent years: (1) it was not developed according to best  
17       practices in distribution planning; (2) it recommends investment dramatically  
18       above and beyond "business as usual" investments; (3) it requests extraordinary  
19       ratemaking treatment, which would provide additional incentive to invest; and (4)  
20       it is justified by cost-benefit calculations based on irregularities and weak  
21       assumptions, as described in Witness Alvarez's testimony. I believe these  
22       characteristics render the GIP fundamentally flawed, and that the GIP would not  
23       meet North Carolina's need for low-cost, safe, reliable, and increasingly clean  
24       electricity.

1           The North Carolina economy and ratepayers can only bear so much rate  
2           increase. As a result, grid investments must be very carefully considered and  
3           prioritized. Failure to do so presents its own kinds of risks to the North Carolina  
4           economy. It also presents risks to the achievement of North Carolina's Clean  
5           Energy Plan,<sup>6</sup> as rate increases wasted on cost-ineffective investments are no  
6           longer available to fund grid capabilities offering better "bang for the buck." My  
7           testimony is intended to provide a basic technical evaluation of GIP programs and  
8           sub-components to help the Commission make informed choices regarding Duke  
9           Energy's GIP.

10   **Q. PLEASE PROVIDE EVIDENCE TO SUPPORT YOUR ASSERTION THAT**  
11   **RELIABILITY OF DUKE ENERGY'S NORTH CAROLINA GRID HAS**  
12   **DETERIORATED SIGNIFICANTLY IN RECENT YEARS DESPITE**  
13   **DRAMATIC INCREASES IN GRID INVESTMENT.**

14   A. I completed the same reliability vs. investment analyses for DEC (Figure 1) and  
15   DEP (Figure 2) that Witness Alvarez completed on a national basis, which is  
16   contained in his testimony that is being filed in this docket concurrently.<sup>7</sup> While  
17   growth in peak demand does justify much of DEC's and DEP's grid investment  
18   increases, DEC and DEP's respective grid investment increases exceed peak  
19   demand growth by 37% and 61%.<sup>8</sup> One would hope these excess investments  
20   would lead to at least some reliability improvements. Yet, as is the case  
21   nationally, DEC and DEP's performance under key indices of reliability, the

---

<sup>6</sup> Report by the North Carolina Department of Environmental Quality. October, 2019. Available here: [https://files.nc.gov/ncdeq/climate-change/clean-energy-plan/NC\\_Clean\\_Energy\\_Plan\\_OCT\\_2019\\_.pdf](https://files.nc.gov/ncdeq/climate-change/clean-energy-plan/NC_Clean_Energy_Plan_OCT_2019_.pdf)

<sup>7</sup> Sources: FERC Form 1 and EIA Form 861 data, 2013 through 2018.

System Average Interruption Duration Index (“SAIDI”) and System Average Interruption Frequency Index (“SAIFI”), have deteriorated significantly despite grid investment in excess of capacity needs. (Note that for SAIDI and SAIFI, lower values represent better performance.)

*Figure 1: Relationship between Grid Investment and Reliability for DEC*

*Figure 2: Relationship between Grid Investment and Reliability for DEP<sup>9</sup>*

<sup>9</sup> As referenced above, DEC and DEP are each presenting the GIP program for approval in their respective concurrent rate cases. To that end, I have included DEC and DEP analysis here as it supports my point that historical investments do not correlate with SAIDI and SAIFI improvements. I believe this is a key indictment of the GIP.

1           As shown in Figure 1, DEC's SAIDI and SAIFI performance have  
2           deteriorated almost 60% and more than 20%, respectively, since 2013 despite grid  
3           investment growth 37% greater than peak demand growth. As shown in Figure 2,  
4           DEP's SAIDI and SAIFI performance have deteriorated almost 50% and more  
5           than 5%, respectively, since 2013 despite grid investment growth 61% greater  
6           than peak demand growth.

7   **Q.   WHAT DO YOU CONCLUDE FROM THIS DATA?**

8   A.   I do not conclude from this data that investments in reliability or weather event  
9           resilience are bad ideas. Instead, I conclude from this data that the grid  
10          investments that DEC and DEP have been making in recent years do not appear to  
11          be achieving the intended results. In light of this, Duke's proposed investments in  
12          the grid to improve reliability, enhance resilience, or facilitate deployment of  
13          DERs must be very carefully considered and prioritized.

**IV.   GIP Programs Meriting Approval with Conditions**

14   **Q.   PLEASE PROVIDE A PREVIEW OF THIS SECTION OF YOUR**  
15          **TESTIMONY.**

16   A.   Should the Commission disagree with my primary recommendation to deny the  
17          request for approval of the GIP and institute a proceeding to develop a  
18          transparent, stakeholder-engaged distribution planning and capital budgeting  
19          process, then, in the alternative, some of the GIP programs may be approved with  
20          conditions. In this section of my testimony, I will discuss the GIP programs and  
21          sub-components that I believe, under my secondary recommendation, may merit  
22          approval with conditions. I will describe my rationale for these programs' merits,

1 as well as conditions I believe the Commission should require in the event it  
2 approves spending for these programs and sub-components. I will conclude this  
3 section with a discussion regarding the potential value of a transparent,  
4 stakeholder-engaged distribution planning and capital budgeting process, as I  
5 believe such a process could improve the GIP even among meritorious programs.  
6 The GIP programs and sub-programs that I believe may merit approval with  
7 conditions include:

- 8 • Integrated Volt-VAR Control (“IVVC”);
- 9 • Flood and Animal Mitigation portions of Transmission Hardening and  
10 Resilience;
- 11 • Long Duration Interruption/High Impact Sites;
- 12 • Enterprise Applications, ISOP software, and DER dispatch software;
- 13 • Cyber security portions of Physical and Cyber Security; and
- 14 • Power electronics for Volt-VAR Control.

15 **Q. WHY DO YOU BELIEVE THESE GIP PROGRAMS MAY MERIT**  
16 **APPROVAL WITH CONDITIONS?**

17 A. All of the GIP programs on this list satisfy one or more of the following criteria:

- 18 • They represent standard industry practice;
- 19 • They consist of software needed to optimize grid assets or operations, or  
20 to improve cyber security;
- 21 • They are likely, with conditions, to deliver benefits to ratepayers in excess  
22 of costs to ratepayers without material modifications of the program as  
23 proposed;

- 1                   • They are critical to stakeholders' value that cannot be otherwise secured.

2   **Q.   WHAT CONDITIONS DO YOU RECOMMEND THE COMMISSION**  
3   **ATTACH TO APPROVAL OF THESE PROGRAMS?**

4   A.   The Commission should consider attaching a common set of conditions to any  
5       and every GIP program it might approve. These conditions include cost controls,  
6       operating audits, and performance measurement.

7   **Q.   PLEASE DESCRIBE THE COST CONTROL CONDITIONS.**

8   A.   As described in Witness Alvarez's testimony, there are significant differences  
9       between the program capital amounts provided in the GIP<sup>10</sup> and the program  
10      capital amounts provided in the benefit-cost analyses. I also note the equivocal  
11      response to a clear request during discovery about the amount of capital being  
12      requested for the GIP, to which Duke Energy responded it is only requesting,  
13      though I am paraphrasing: (1) a return on and of capital spent on GIP assets  
14      placed in service as of the closing date of this rate case; and (2) deferred  
15      accounting treatment for GIP assets placed in service between this rate case and  
16      the next rate case.<sup>11</sup> I find this level of ambiguity concerning, and believe the  
17      Commission should share my concern. I do not believe ratepayers will be best  
18      served if Duke Energy treats GIP capital as a pot of money it can invest as it  
19      wishes.

---

<sup>10</sup> Oliver Direct, Exhibit 10, page 3.

<sup>11</sup> Duke Energy Carolinas Response to NCJC et al. Data Request No. (hereinafter, "DR") 5-4(a), NCUC Docket No. E-7, Sub 1214. attached as Stephens Exhibit 2. (References to DEC responses to data requests are to those served in NCUC Docket No. E-7, Sub 1214.)

1           Instead, any GIP program the Commission approves should include a  
2           clearly defined functional scope, a clearly defined geographic scope, and capital  
3           budget sufficient to secure the functionality for the defined geography. This is  
4           consistent with the accountability issue Witness Alvarez raises in his testimony,  
5           but on the cost side of the benefit-cost equation. Furthermore, I am concerned  
6           that ratepayers will bear 100% of the risk of any cost overruns or scope  
7           shortcomings. I encourage the Commission to consider cost caps for specific  
8           programs and scopes, complete with ratepayer protections (such as 50/50 cost  
9           sharing between ratepayers and shareholders for cost overruns). Finally, program  
10          cost caps should incorporate all capital for each program, including capital spent  
11          prior to the end of the test year in this rate case.

12   **Q.     PLEASE DESCRIBE THE OPERATING AUDITS.**

13   A.     This condition is closely tied to cost caps. In my experience, an investor-owned  
14          utility at risk for exceeding a cost cap with consequences will simply reduce  
15          functionality or geographic scope in order to remain under the cap/avoid the  
16          consequences. This is not the intended outcome of the cost caps condition. As a  
17          result, I also recommend operating audits, with appropriate use of random  
18          sampling, to validate the functionality and geographic scope of any and all  
19          approved GIP programs. For example, if the GIP proposes that Duke Energy will  
20          add IVVC to 1800 circuits for \$200 million by 2024, an operating audit conducted  
21          in 2025 should validate that IVVC software is providing instructions to IVVC  
22          equipment installed on 1800 circuits.

23   **Q.     PLEASE DESCRIBE PERFORMANCE MEASUREMENT CONDITIONS.**

1 A. Performance measurement should be a condition of every program for which  
2 performance is likely to be variable. Baseline performance levels should be  
3 measured before capabilities are added, and post-deployment performance should  
4 be measured on an ongoing basis. Performance measurement is critical for  
5 ensuring that ratepayer benefits are being maximized, and increased over time,  
6 but also to inform potential future expansions or curtailments of GIP programs.

7 In this group of meritorious programs, IVVC stands out as a program  
8 requiring performance measurement. Duke Energy should be required to report  
9 baseline and annual average voltage for every circuit with IVVC capabilities.  
10 Ameren Illinois' IVVC measurement and validation program is an excellent  
11 example of sound IVVC performance measurement.<sup>12</sup>

12 **Q. BEFORE PROCEEDING, PLEASE COMMENT ON THE**  
13 **RESTRICTIONS THAT DUKE ENERGY IS PLACING ON DER**  
14 **INSTALLATIONS DUE TO VOLTAGE CONCERNS.**

15 A. In its Method of Service Guidelines, Duke Energy describes limitations it is  
16 placing on DER locations due to operational voltage issues. The rationale for  
17 these limitations -- challenges associated with non-standard line voltage regulator  
18 ("LVR") settings -- are not valid from a technical perspective. I can understand  
19 why grid operators would want to minimize the reconfiguration flexibility  
20 reductions associated with non-standard LVR settings. But new loads routinely  
21 serve to reduce reconfiguration flexibility; it is part of grid operators' job to  
22 manage around reconfiguration flexibility reductions, and they do so successfully

---

<sup>12</sup> Illinois Commerce Commission 18-0211. *Ameren Illinois Voltage Optimization Plan*. Jan 25, 2018. P. 27-30.

1 all the time. Regarding backfeed, it is easy to manage as long as DER relative to  
2 load is not extremely high. When DER relative to load does get high,  
3 technologies are available to manage backfeed. Nor are voltage issues generally,  
4 or the presence of IVVC capabilities specifically, a reason to restrict DER on a  
5 circuit. Capacitor banks, smart inverters, and IVVC software setting adjustments  
6 can all be employed to cope with volt-VAR issues related to DER.

7 To summarize, neither stakeholders nor the Commission should accept  
8 Duke Energy's limitations on DER without a technical challenge. The fact that a  
9 DER installation might make a grid operator's job more difficult is not an  
10 acceptable restriction rationale, and the software Duke Energy is installing, and  
11 which I have categorized as "merits approval with conditions" in this testimony,  
12 will help grid operators manage DER capacity growth. The unwarranted  
13 restriction of DER locations appears to me to be yet another reason to implement  
14 a transparent, stakeholder-engaged distribution planning and capital budgeting  
15 process in North Carolina.

16 **Q. WHAT KIND OF VALUE COULD A TRANSPARENT, STAKEHOLDER-**  
17 **ENGAGED DISTRIBUTION PLANNING AND CAPITAL BUDGETING**  
18 **PROCESS DELIVER REGARDING THE MERITORIOUS PROGRAMS**  
19 **YOU DESCRIBE IN THIS SECTION?**

20 A. Witness Alvarez's testimony describes a transparent, stakeholder-engaged  
21 distribution planning and capital budgeting process that warrants Commission  
22 consideration. While some will perceive such a process as an attempt to limit grid  
23 investment, I prefer to think of it as a way to optimize grid investment. For  
24 example, while I believe the GIP programs listed in this section may merit

1 approval, I pass no judgement regarding the relative size or mix of the  
2 investments. Should the GIP devote more capital to the IVVC program and less  
3 on cybersecurity? Maybe; it depends on priorities, perceptions of threats, degree  
4 of program effectiveness, risk tolerance, and a host of other variables that exist to  
5 varying degrees within various ratepayers and stakeholders. When a utility makes  
6 these decisions for us, it can only fight stakeholders, as any decision the utility  
7 makes will put it on the wrong side of some stakeholders' interests. When a  
8 utility works with stakeholders as a trusted advisor, explaining the pros and cons  
9 of various approaches to an emerging issue or opportunity, it is able to better align  
10 goals, interests, and priorities and make the right investment choices.

**V. GIP Programs Requiring Material Modifications and Conditions  
to Merit Approval**

11 **Q. PLEASE PROVIDE A PREVIEW OF THIS SECTION OF YOUR**  
12 **TESTIMONY.**

13 A. In this section of my testimony, I will discuss the GIP programs that must be  
14 materially modified in order to merit Commission approval under my secondary  
15 recommendation, including the Self-Optimizing Grid ("SOG") and Transmission  
16 Hardening and Resilience Programs. I will recommend that the SOG budget,  
17 should the Commission approve the program, be reduced to better focus capital  
18 on high-priority circuits and sections. I will recommend that the Transmission  
19 Hardening and Resilience programs be dedicated solely to actual capacity  
20 increases designed to accommodate more DER before they can merit approval.  
21 Otherwise, I recommend the Commission reject this spending entirely. I will also  
22 identify opportunities for a transparent, stakeholder-engaged distribution planning

1 and capital budgeting process to deliver value when considering capital outlays  
2 for these types of programs.

3 A. *Self-Optimizing Grid*

4 **Q. WHAT MATERIAL MODIFICATIONS DO YOU RECOMMEND FOR**  
5 **DUKE ENERGY'S SOG PROGRAM?**

6 A. The notion of “networking” circuits or substations so that a source of back-up  
7 power is available in the event the primary source fails is nothing new. Utilities,  
8 including DEC and DEP, have been sectionalizing circuits and building back-up  
9 supply lines (called tie lines) for decades. Duke Energy’s SOG program simply  
10 does more of this networking, allows it to be executed remotely (without sending  
11 linemen in trucks to throw switches), and with less preparatory analysis (through  
12 software) to ensure a grid reconfiguration doesn’t create more problems than it  
13 solves. However, like all investments intended to improve reliability, the law of  
14 diminishing returns applies. That is, every incremental capital dollar spent  
15 delivers less incremental reliability improvement than the capital dollar just spent.  
16 As mentioned by Witness Alvarez in his testimony, there is a balance to be struck  
17 between reliability and affordability. Taken to an extreme, our grid could be made  
18 perfectly reliable, though few would be able to afford electricity. As it relates to  
19 the SOG program, the questions are (1) to what extent/which circuits to apply it;  
20 and (2) into how many sections should each circuit be split?

21 **Q. HOW DOES ONE DETERMINE THE NUMBER OF/SELECT CIRCUITS**  
22 **TO WHICH TO APPLY THE NETWORKING CONCEPT?**

23 A. It is part art and part science, and is yet another example of why a transparent,  
24 stakeholder-engaged approach to distribution planning and capital budgeting

creates value for ratepayers. All else being equal, circuits with greater numbers of ratepayers will receive greater benefits from networking than circuits with fewer numbers of ratepayers. But not all ratepayers are created equal. As the long duration interruption/high impact sites program recognizes, reliability is more critical to some facilities/districts (hospitals, airports, downtowns) than others. What I can tell you for certain is that the benefit-to-cost ratio improves as the focus of networking spending tightens. The concept is best illustrated by example. Consider six circuits, each of which has the same cost for networking, and a variety of projected benefits:

Circuit Number	Networking Cost	Projected Benefit
1	\$2	\$3.00
2	\$2	\$2.75
3	\$2	\$2.50
4	\$2	\$2.25
5	\$2	\$2.10
6	\$2	\$2.05
Totals	\$12	\$14.65

Assume that cost estimates are solid, but that benefit estimates are less so. As Witness Alvarez's testimony indicates, benefit estimates are generally subject to a significant number of assumptions that cannot be assured. While the networking program in the hypothetical example indicates a benefit-to-cost ratio of 1.2 to 1 (\$14.65/\$12), the benefit cost ratio could be improved to 1.65 to 1 (\$8.25/\$5) by

1 limiting the investment to the first three circuits. Note that a benefit variance of  
2 as little as 10% makes circuits 5 and 6 cost-ineffective, and a benefit variance of  
3 as little as 15% also makes circuit 4 cost-ineffective. So, reducing the number of  
4 circuits not only improves the benefit-to-cost ratio, it reduces the risk that the  
5 treatment (in this case SOG) will cost more than the benefits delivered,  
6 particularly considering the variability surrounding benefit estimates.

7 **Q. HOW DOES ONE DETERMINE THE NUMBER OF SEGMENTS INTO**  
8 **WHICH A CIRCUIT SHOULD BE DIVIDED?**

9 A. The law of diminishing returns applies here too. Consider a circuit with 1,000  
10 ratepayers. Splitting this circuit up into two segments will enable 500 ratepayers  
11 to receive power from a back-up source when the primary source fails, a 50%  
12 improvement. Now consider splitting this circuit into three circuits, which would  
13 enable 667 ratepayers to receive power from a back-up source when the primary  
14 source fails. While a 66% improvement is better than a 50% improvement, note  
15 that the incremental improvement of three sections over two is only 16%, while  
16 the incremental improvement of two sections over one is 50%. Each additional  
17 section – four, five, or six – will each deliver less and less incremental benefit.  
18 Such is the law of diminishing returns, and the concept is useful to consider not  
19 just within a program, but between programs, and even for an overall distribution  
20 rate base. It is yet another example of why distribution planning and capital  
21 budgets must be carefully considered and prioritized, ideally with the input of  
22 educated and informed stakeholders.

1 **Q. HOW DO THESE OBSERVATIONS INFORM YOUR**  
2 **RECOMMENDATION FOR MATERIAL MODIFICATIONS TO DUKE**  
3 **ENERGY’S SOG PROGRAM?**

4 A. My recommendation is that the fixed costs of the SOG proposal, including the  
5 Advanced Distribution Management System (“ADMS”) and proof-of-concept  
6 (\$48.9 million) be approved, while the variable portion – the extent to which SOG  
7 is deployed geographically – be cut in half (from \$673.6 million to \$336.8  
8 million). While I have significant concerns about ADMS, which I will discuss, I  
9 believe this solution will increase the benefit-to-cost ratio of the SOG program,  
10 and reduce the risk that SOG capital will be applied to circuits that will not  
11 deliver benefits in excess of cost. As indicated in Witness Alvarez’s testimony,  
12 the reliability of Duke Energy’s benefit estimates is questionable, meaning that  
13 variability in benefit delivery is likely to be high. Stakeholder engagement could  
14 be used to establish criteria for circuit prioritization.

15 Another reason to cut the SOG capital budget is the high degree of  
16 variation in capital cost estimates. In discovery, Duke Energy admitted that SOG  
17 cost estimates were prepared at an AACE Class 4 level of detail.<sup>13</sup> Class 4 cost  
18 estimates are only accurate to within minus 30%/plus 50%, so better to approve a  
19 smaller budget until better cost estimates can be developed for specific circuits.  
20 Finally, all the conditions I described in the previous section of my testimony –  
21 cost caps, operating audits, and performance measurement – should apply to all  
22 programs, including SOG, which the Commission elects to approve (if any).

---

<sup>13</sup> DEC Response to NCJC DR 4-6, attached as Stephens Exhibit 3.

1   **Q.   WHAT ARE YOUR CONCERNS ABOUT DUKE ENERGY’S \$48**  
2   **MILLION ADMS PROPOSAL?**

3   A.   ADMS consists of a suite of software applications that are then combined into a  
4       single operating platform. In my experience, the value comes from the underlying  
5       software applications, including fault locating, isolation and service restoration  
6       (“FLISR”) and integrated Volt-VAR control (“IVVC”). In general, with the  
7       possible exception of outage management system integration, the combination  
8       into a single operating platform, though intuitively appealing, provides little  
9       actual economic benefit. Similarly, I have seen utilities waste tens of millions of  
10      dollars pursuing grid automation – enabling software, not grid operators in control  
11      centers – to reconfigure the grid. Not only is this sort of automation extremely  
12      costly to implement, to little economic benefit, it requires an extreme, ongoing  
13      level of dedication and attention to field device software updates, GIS map system  
14      accuracy, accurate location and device setting monitoring, communications  
15      network attention, and logical equipment identification. If the logical  
16      specifications do not precisely match physical specifications, for every device,  
17      100% of the time, automation efforts will fail.<sup>14</sup> When O&M budgets are  
18      stretched, or under the pressure of a service restoration effort, humans take  
19      shortcuts. Full grid automation, where some see ADMS heading, thus requires a  
20      level of management and employee attention that may be unattainable, and  
21      involves a great deal of risk. Due to the underlying suite of software applications,  
22      I hesitate to recommend the Commission reject ADMS. But, due to the

---

<sup>14</sup> Many of these concerns are described in a US Department of Energy whitepaper dedicated to the subject. US Department of Energy. *Voices of Experience: Insights into Advanced Distribution Management Systems*. Whitepaper. February, 2015.

1 challenges and overreaches I describe, I absolutely recommend the Commission  
2 apply cost cap and operating audit conditions to any self-optimizing grid and  
3 ADMS capital spending the Commission might approve.

4 *B. Transmission Hardening and Resilience (Excluding Flood and Animal*  
5 *Mitigation)*

6 **Q. WHAT MATERIAL MODIFICATIONS DO YOU RECOMMEND FOR**  
7 **DUKE ENERGY'S TRANSMISSION HARDENING AND RESILIENCE**  
8 **PROGRAM?**

9 A. While my suggested modifications to the self-optimizing grid program amounted  
10 to a relatively simple reduction in scope, my suggested modifications to the  
11 transmission hardening and resilience program amount to a complete redesign of  
12 the program and a repurposing of the \$120 million transmission hardening and  
13 resilience budget (excluding substation flood and animal mitigation components,  
14 which I included in the "merit approval" category).

15 **Q. WHY DO YOU RECOMMEND THE TRANSMISSION HARDENING AND**  
16 **RESILIENCE BUDGET BE COMPLETELY REPURPOSED?**

17 A. Duke Energy describes its transmission hardening and resilience program as a  
18 way to improve reliability, projecting that ratepayers will receive \$2 billion in  
19 economic benefits. However, given the extremely low historical failure rates of  
20 the transmission equipment DEP proposes to replace, including static lines and  
21 support structures, there is no way the replacements proposed can possibly avoid  
22 the number of failures required to produce the economic benefits projected.<sup>15</sup> In  
23 my experience, low transmission failure rates are common, as transmission

---

<sup>15</sup> Witness Alvarez provides these historical failure rates in his testimony.

1 designers recognize the larger number of ratepayers impacted by failures on such  
2 systems, and overbuild accordingly. But my concerns regarding benefit projects  
3 are trumped by an even bigger concern: the transmission hardening and resilience  
4 program proposed will not increase the capacity of the system to accommodate  
5 greater DER capacity by a single watt.

6 **Q. ARE YOU SURE? DUKE ENERGY'S GIP STATES ITS TRANSMISSION**  
7 **AND RESILIENCE PROGRAM "BEGINS TO PAVE THE WAY FOR**  
8 **MORE DER INTERCONNECTIONS."**

9 A. As part of the transmission hardening and resilience program, DEP is only  
10 replacing some support structures (poles) and static lines. These activities will  
11 not increase DER capacity. Nor, as described above and by Witness Alvarez, will  
12 these activities deliver the reliability benefits Duke Energy projects. My  
13 recommendation is to repurpose the entire \$120 million Duke Energy proposes to  
14 invest in its transmission hardening and resilience program specifically to increase  
15 the system's DER capacity. Stakeholder engagement would be valuable in  
16 allocating this capital in ways that maximize the amount of new DER capacity  
17 accommodated for the least cost. The deficiencies in Duke Energy's transmission  
18 hardening and resilience proposal illustrate the potential value of a transparent,  
19 stakeholder-engaged distribution planning and capital budgeting process.

**VI. GIP Programs That Should Be Rejected Due to Lack of Cost  
Effectiveness/Compliance with Standard Industry Practice**

20 **Q. PLEASE PROVIDE A PREVIEW OF THIS SECTION OF YOUR**  
21 **TESTIMONY.**

1 A. In this section of my testimony, I will discuss GIP programs that should be  
2 rejected in any scenario. None of these programs are standard industry practice as  
3 they are generally recognized as not cost-effective. They include:

- 4 • Targeted Undergrounding (\$114.5 million);
- 5 • Distribution Transformer Retrofits (\$118.0 million);
- 6 • Transformer Bank Replacements (\$116.4 million);
- 7 • Oil-Filled Breaker Replacements (\$200.3 million); and
- 8 • Substation Physical Security (\$110.7 million).

9 A. *Targeting Undergrounding*

10 **Q. WHY DO YOU BELIEVE TARGETED UNDERGROUNDING MERITS**  
11 **REJECTION?**

12 A. Undergrounding of overhead lines is not a standard industry practice for many  
13 reasons. Undergrounding may be intuitively appealing, but it is not the panacea  
14 that utilities would like stakeholders to believe. While undergrounding reduces  
15 the risk of service interruptions due to vegetation contact and weather, it increases  
16 the risk of service interruptions due to flooding and digging. While  
17 undergrounding reduces the hassle associated with repairing lines in residential  
18 ratepayers' backyards, the time to locate and repair underground faults generally  
19 takes longer than the time to locate and repair faults on overhead lines. While  
20 aesthetically appealing in principle, in practice almost 100% of utility poles will  
21 remain in place, supporting telephone, Internet, and cable television service lines.  
22 While undergrounding may eliminate a small portion of Duke Energy's tree  
23 trimming costs, some other service provider will still need to clear vegetation, that

1 means ratepayers will still pay; underground cable is also more costly than  
2 overhead conductor, and must be replaced more frequently. A Lawrence Berkeley  
3 National Laboratory review of undergrounding programs also noted an increase in  
4 utility employee safety risks associated with undergrounding.<sup>16</sup>

5 Furthermore, undergrounding is extremely costly and not cost-effective,  
6 and it is not simply my experience that tells me so. The Lawrence Berkeley  
7 National Lab undergrounding study indicates that the benefit-to-cost ratio of  
8 undergrounding is 0.3 to 1.0 (that is, costs exceed benefits by a factor of more  
9 than three).<sup>17</sup> For these reasons, the Virginia State Corporation Commission  
10 (“SCC”) rejected undergrounding programs proposed by Dominion multiple  
11 times. Duke Energy’s program proposes to underground the lines serving just  
12 22,477 ratepayers<sup>18</sup> at a cost of \$169.3 million,<sup>19</sup> or at least \$7,500 per ratepayer  
13 undergrounded. To justify the program, Duke Energy claims that undergrounding  
14 will reduce the momentary outages to commercial and industrial (“C&I”)   
15 ratepayers upstream of the residential areas. In fact, Duke Energy attributes of  
16 90% of the benefits it projects from targeted undergrounding to this single value  
17 proposition.

18 **Q. DO YOU BELIEVE THAT JUSTIFYING THE INSTALLATION OF**  
19 **TARGETED UNDERGROUNDING BASED ON THE EFFECT OF**  
20 **UPSTREAM MOMENTARY OUTAGES IS INAPPROPRIATE?**

---

<sup>16</sup> Larsen P. A Method to Estimate the Costs and Benefits of Undergrounding Electricity Transmission and Distribution Lines. Lawrence Berkeley National Laboratory. October 2016. Page 7.

<sup>17</sup> Ibid, parts of the document not paginated, see PDF file page 42.

<sup>18</sup> Oliver Direct, Ex. 7 workbook “TUG\_DEC-DEP\_NC\_19-22\_Consolidated\_vF rev1 8-9-19.xlsx”, tab “Area Data – Condensed”, line “Total Ratepayers Affected”.

<sup>19</sup> Ibid, tab “All Years Tab Summary”, cell D21.

1     A.     As indicated in Mr. Alvarez's testimony, the cost per momentary outage to various  
2           rate class ratepayers is exaggerated. In addition, I would like to point out a few  
3           factors that contribute to Duke Energy's exaggeration of the amount of upstream  
4           momentaries caused by backlot line overhead lines.

5                 First, Duke Energy admitted in discovery that not all outages result in an  
6           upstream momentary event.<sup>20</sup> The purpose of coordinating the operation of fuses  
7           with upstream devices is often intended to eliminate an upstream operation. That  
8           is to say, that the upstream relay is set such that the downstream fuse will clear or  
9           blow, for faults of sufficient magnitude, resulting in no upstream momentary  
10          outage.

11                Second, the reason for most momentary outages is that the utility has  
12          installed a "Fast" or "Fuse Saving" relay setting on the upstream device, which is  
13          designed to open the upstream device and allow a fault to clear. This opening  
14          operation is the momentary outage. These upstream device settings are typically  
15          set for one fast trip before moving to the slower trips which would cause a  
16          downstream device such as a fuse to clear. The point is, a simple adjustment to  
17          upstream device trip settings can eliminate C&I momentaries caused by  
18          downstream events.

19                Third, Duke Energy's reliability improvement estimates assume 2.7  
20          momentaries for every sustained outage. I believe this estimate is too high. As  
21          indicated above, relays are typically set for one fast trip, not multiple fast trips,

---

<sup>20</sup> DEC Response to NCSEA DR 3-32, attached as Stephens Exhibit 4.

1       which would result in one momentary upstream outage before the fuse clears, not  
2       2.7. The fuse again would be coordinated with the relay setting following the  
3       “Fast” trip setting such that the fuse would clear prior to the upstream device  
4       opening again after the fast trip opening. This would result in one momentary for  
5       upstream ratepayers. The only reasonable course of action is to evaluate the  
6       upstream momentaries on a circuit-by-circuit basis.

7               Fourth, Duke Energy admitted in discovery that eliminating the “Fast”  
8       Trip on the upstream device would eliminate most of the momentaries  
9       experienced by the upstream C&I ratepayers.<sup>21</sup> Duke Energy did point out that  
10      this would result in increased downstream outages and trips to the field; however,  
11      the value Duke Energy placed on upstream C&I ratepayer momentaries greatly  
12      outweighs the value of downstream outages. If this is the case, then the best  
13      course of action would be to eliminate the “Fast” trip setting on upstream devices  
14      rather than spend \$114.5 million undergrounding downstream segments in just 55  
15      neighborhoods. I note that estimated economic benefits for many GIP programs  
16      consist largely or mainly of a reduction in upstream momentaries for C&I  
17      ratepayers. The preceding comments apply to all of these programs.

18              Finally, I must comment on the extremely high costs of undergrounding.  
19      While Duke Energy estimates the cost at \$850,000 per undergrounded mile, I note  
20      that the proposed undergrounding program incorporates “looping” of underground

---

<sup>21</sup> DEC Response to NCJC DR 5-33, attached as Stephens Exhibit 5.

1 cables -- burying twice as much cable as would otherwise be required<sup>22</sup> – to  
2 further enhance reliability and flexibility. The cost of undergrounding therefore  
3 amounts to \$1.7 million per mile of overhead conductor undergrounded, or 4.5  
4 times the cost of replacing overhead conductor with new,<sup>23</sup> even if it were  
5 warranted. While this finding does not change the miles or budgets of the  
6 proposed targeted undergrounding program, I feel it is important for the  
7 Commission to understand just how expensive this program is. Given the small  
8 incremental improvement in reliability, the negative benefit-to-cost ratio found in  
9 research, and the low-cost alternatives available to improve reliability I describe  
10 above, the Commission must strongly consider better ways to spend the capital  
11 for which customers will be asked to pay. Like all other GIP programs, a  
12 transparent, stakeholder-engaged review of undergrounding benefits, costs, and  
13 options would likely result in a different decision regarding the practice than  
14 Duke Energy proposes.

15 *B. Distribution Transformer Retrofits*

16 **Q. WHY DO YOU BELIEVE THE DISTRIBUTION TRANSFORMER**  
17 **RETROFIT PROGRAM MERITS REJECTION?**

18 A. The distribution transformer retrofit program that Duke Energy is proposing is not  
19 standard practice, and is not likely cost-effective. Duke Energy operates 784,000  
20 distribution transformers in North Carolina; in an average year slightly fewer than

---

<sup>22</sup> Duke Energy Progress Response to NCJC Data Request 6-4, Docket No. E-2, Sub 1219, attached as Stephens Exhibit 6.

<sup>23</sup> Oliver Direct, Ex. 7 workbook “TUG\_DEC-DEP\_NC\_19-22\_Consolidated\_vF rev1 8-9-19.xlsx”, tab “Lookups”, line 23 “Cost/Mile to Replace Backlot Conductor” (\$375,000) divided into \$1.7 million.

1           6,000 of them, or less than 1%, will fail.<sup>24</sup> As with targeted undergrounding, the  
2           value proposition proffered by Duke consists almost entirely of protecting C&I  
3           ratepayers from downstream service outages; 93% of the benefits Duke Energy  
4           projects stem from this claim.<sup>25</sup> Duke indicates that the transformers and  
5           secondary systems that are planned for retrofit are operating safely.<sup>26</sup>  
6           Additionally, Duke could provide no indication of outages or outage complaints  
7           associated with these transformers on secondary lines<sup>27</sup>

8                     Duke indicated that many of the transformers that are involved in the  
9           retrofit project are Completely Self Protected (“CSP”) transformers.<sup>28</sup> These  
10          transformers have internal fuses that protect the transformer from internal faults.  
11          Thus, even though the distribution transformer retrofit project is intended to  
12          protect the transformer and the secondary line, the program is duplicative for the  
13          transformer portion of the value proposition.

14                    In discovery, Duke Energy indicated the trip setting on the transformer  
15          retrofit devices would be set such that the retrofitted distribution transformer  
16          would trip before any upstream devices could trip.<sup>29</sup> This is counterproductive.  
17          The reason for enabling a fast trip setting on upstream devices is to allow a fault  
18          to clear before the downstream device (in this case the retrofitted distribution

<sup>27</sup> *Id.*

<sup>28</sup> DEC Response to NCJC DR 8-34. DEC could not provide an exact count; however, most of the distribution transformers installed by utilities in the last 40 years have been of the CSP type.

<sup>29</sup> DEC Response to NCJC DR 5-40, attached as Stephens Exhibit 8.

transformer) clears or opens. The transformer retrofit program would install a device downstream that clears or opens before the upstream fast trip device can prevent it from operating. This is clearly counterproductive and a waste.

*C. Transformer Bank Replacement*

**Q. EXPLAIN WHY THE TRANSFORMER BANK REPLACEMENT PROGRAM SHOULD BE REJECTED.**

A. Substation transformers are typically situated in groups of three, constituting a transformer bank. Unlike distribution transformers, substation transformers (also known as transmission transformers) typically serve one or two thousand ratepayers each. However, as transformer oil can be tested, and used to predict transformer failure, there is no reason whatsoever to replace transformers in the absence of test results. As a result, substation transformer oil testing and failure prediction is a standard industry practice; prospective substation transformer replacement in the absence of test results is not.

Witness Alvarez provides historical substation transformer failure rates in his testimony; they are extremely low, as I would expect. The large benefits Duke Energy projects from avoiding future transformer failures through prospective replacement do not square at all with historically low transformer failure rates. Prospective substation transformer replacement, and particularly the proactive replacement of entire transformer banks, in the absence of test results, should be rejected.

1     D.     *Oil-Filled Breaker Replacement*

2     **Q.     EXPLAIN WHY THE OIL-FILLED BREAKER REPLACEMENT**  
3     **PROGRAM SHOULD BE REJECTED.**

4     A.     Circuit breakers, like transformers, can be tested. It is standard industry practice  
5     to test circuit breakers at regular intervals, and to track the number of operations  
6     (trips) for each breaker. When a circuit breaker fails a test, or reaches its rated  
7     number of operations, it is standard industry practice to replace it. Replacing  
8     circuit breakers in the absence of test failure or operating counts is not standard  
9     practice.

10                 Again, there is a reason prospective circuit breaker replacement is not  
11     standard industry practice. Witness Alvarez provides historical circuit breaker  
12     failure rates in his testimony; as with transformer failures, the failure rate has been  
13     extremely low. The large benefits Duke Energy projects from avoiding future  
14     circuit breaker failures through prospective replacement do not reconcile with  
15     historically low transformer failure rates.

16     **Q.     BUT DUKE ENERGY DESCRIBES BENEFITS OTHER THAN**  
17     **RELIABILITY IMPROVEMENTS FROM CIRCUIT BREAKER**  
18     **REPLACEMENT, DOES IT NOT?**

19     A.     Yes. Duke Energy claims that the new circuit breakers will have remote  
20     monitoring and control capabilities that the oil circuit breakers do not have.  
21     While this may be true, I note that retrofit kits are available to provide these same  
22     capabilities for oil circuit breakers at the fraction of the cost of a new circuit  
23     breaker. Duke Energy also claims that about one-third of the economic benefits  
24     of the circuit breaker replacement program stem from the avoidance of

1 replacement in the future. I do not see this as a “benefit” at all. When a circuit  
2 breaker needs to be replaced, it should be replaced. Replacing a circuit breaker  
3 before it becomes necessary to do so does not avoid any costs at all; rather, it  
4 advances the cost, requiring ratepayers to pay today for something they could  
5 have been spared until some future test failure. I note Duke Energy applies this  
6 nonsensical benefit to other programs too, including targeted undergrounding and  
7 transformer bank replacement. Witness Alvarez quantifies this in his testimony  
8 regarding overstated benefits.

9 *E. Substation Physical Security*

10 **Q. EXPLAIN WHY THE PHYSICAL SUBSTATION SECURITY PROGRAM**  
11 **SHOULD BE REJECTED.**

12 A. As with the other programs that merit rejection, there is no standard industry  
13 practice or security standard associated with the physical substation security  
14 upgrades Duke Energy is proposing. The physical substation security program  
15 includes the installation of high-security fencing, gates, cameras, and lighting at a  
16 cost of \$4.2 million per substation. This amount includes \$800,000 per substation  
17 just for a prefabricated building to house physical security equipment.<sup>30</sup> At a  
18 proposed budget of \$110 million, this program will upgrade the physical security  
19 of just 27 substations. Although that will leave Duke Energy with 2,088 (99%) of  
20 its substations with standard fencing, I am pleased to report that Duke Energy has  
21 never recorded a single incident of unauthorized substation intrusion.<sup>31</sup> There  
22 must be more valuable ways for Duke Energy to deploy capital, and this proposed

---

<sup>31</sup> DEC Response to NCSEA DR 2-19 (b), attached as Stephens Exhibit 10.

1 program illustrates another potential opportunity for a transparent, stakeholder-  
2 engaged distribution planning and capital budgeting process to create value for  
3 ratepayers.

## **VII. GIP Programs That Should Be Rejected Pending Further Evaluation**

4 **Q. PLEASE PROVIDE A PREVIEW OF THIS SECTION OF YOUR**  
5 **TESTIMONY.**

6 A. In this section of my testimony, I will describe GIP programs that should be  
7 rejected pending further evaluation, because critical evaluations are missing that  
8 will require extensive effort beyond the scope of this proceeding. I will also  
9 identify opportunities for a transparent, stakeholder-engaged distribution planning  
10 and capital budgeting process to deliver value when considering these types of  
11 programs. Programs that should be rejected pending further evaluation include:

- 12 • Enterprise Communications Mission Critical Voice, Data (\$52.5, \$107.1  
13 million);
- 14 • Distribution Automation (\$194.3 million); and
- 15 • Transmission System Intelligence (\$86.4 million).

16 A. *Mission Critical Voice and Data Network Programs*

17 **Q. WHAT CRITICAL EVALUATIONS ARE MISSING FROM DUKE**  
18 **ENERGY'S PROPOSED VOICE AND DATA NETWORK**  
19 **DEVELOPMENT PROGRAMS?**

20 A. Witness Alvarez describes the evaluations missing from these proposed programs,  
21 so I will not repeat those here. While neither Witness Alvarez nor I are  
22 communications experts, I appreciate his concern that Duke Energy completed no

1 technical or economic make vs. buy evaluation of alternatives to Duke Energy's  
2 \$160 million proposal to build proprietary voice and data communication  
3 networks.<sup>32</sup> In this Internet of Things age, when public wireless carriers are  
4 introducing high data transfer rates, dedicated bandwidth, and ever-improving  
5 cybersecurity capabilities, it seems more than appropriate to me that an in-depth  
6 evaluation of Duke Energy's claimed voice and data requirements, along with  
7 potential options to satisfy them, be conducted. Stakeholders may need to enlist  
8 expert services to properly participate in such an effort, but that seems preferable  
9 to "waving through" a \$160 million investment that has not been thoroughly  
10 evaluated. Due to the lack of technical or economic make vs. buy analyses, I  
11 agree with Witness Alvarez that this GIP program be rejected pending a more  
12 thorough evaluation.

13 *B. Distribution Automation and Transmission System Intelligence Programs*

14 **Q. WHAT CRITICAL EVALUATIONS ARE MISSING FROM THE**  
15 **DISTRIBUTION AUTOMATION AND TRANSMISSION SYSTEM**  
16 **INTELLIGENCE PROGRAMS?**

17 A. Duke Energy provides no benefit-cost analyses for these programs, claiming they  
18 are "modernization" programs. I do not understand why categorizing them as  
19 modernization programs excuses Duke Energy from the obligation to conduct  
20 benefit-cost analyses. Indeed, in GIP descriptions of these programs,  
21 improvements in reliability and resilience are featured. For all other GIP

---

<sup>32</sup> NCUC Docket # E-7 Sub 1214. DEC Responses to NCSEA DR 2-52(d) and 2-53(e).

1 programs in which improved reliability and resilience are claimed, benefit-cost  
2 analyses were developed; why not for these two programs?

3 I agree that benefits can be difficult to quantify for some programs, and  
4 that some programs merit approval without a benefit-cost analysis, or with a  
5 negative benefit-cost analysis. Indeed, I categorized several GIP programs as  
6 “merit approval with conditions” despite the lack of a benefit-cost analysis.  
7 However, it seems to me that anticipated reliability and/or resilience benefits  
8 should be quantified for any program that is promoted as beneficial to these  
9 outcomes. Failure to quantify the benefits of programs that offer quantifiable  
10 benefits represents a lack of accountability for benefit delivery. I therefore  
11 recommend the Commission reject these programs until Duke Energy completes  
12 benefit-cost analyses for them.

### **VIII. Summary and Recommendations**

13 **Q. PLEASE SUMMARIZE YOUR TESTIMONY AND**  
14 **RECOMMENDATIONS.**

15 A. I began my testimony with context, describing how utilities have conducted  
16 distribution planning to incorporate new technologies and technical challenges for  
17 over a century. I then discussed how investor-owned utilities are changing their  
18 approach from distribution planning to a focus on maximizing capital investment.  
19 I presented historical evidence indicating that the reliability of Duke Energy’s grid  
20 in North Carolina has deteriorated significantly in recent years despite dramatic  
21 increases in grid investment, confirming locally the phenomenon Witness Alvarez

1 describes nationally: grid reliability does not necessarily improve with grid  
2 investment.

3 My testimony then continued with critical evaluations of the individual  
4 programs or sub-components that make up Duke Energy's GIP. My testimony  
5 placed Duke Energy's GIP programs and sub-components into one of five  
6 categories: (1) Those that merit approval with conditions; (2) Those that only  
7 merit approval with material modifications and conditions; (3) Those that do not  
8 merit approval due to lack of cost-effectiveness/compliance with standard  
9 industry practices; (4) Those that merit rejection pending further evaluation; and  
10 (5) Those being considered in other dockets. I justify categorization through  
11 testimony which evaluates the relative merits of each GIP program and sub-  
12 component relative to costs, or identifies missing information prohibiting such  
13 evaluation. My testimony also describes the general conditions I recommend the  
14 Commission establish for any GIP program it approves, and modifications  
15 specific to the self-optimizing grid and transmission hardening & resilience  
16 programs. My testimony concludes with recommendations for the Commission's  
17 consideration, including both primary and secondary (program-specific)  
18 recommendations.

19 My primary recommendation, consistent with Witness Alvarez's  
20 recommendation, is for the Commission to reject Duke Energy's GIP. Instead, I  
21 recommend the Commission establish a proceeding to develop a transparent,  
22 stakeholder-engaged distribution planning and capital budgeting process. Witness  
23 Alvarez's testimony provides additional descriptions and justifications for such a

1 process. In the event the Commission rejects my primary recommendation, I  
2 recommend the Commission follow my program-specific guidance as secondary  
3 recommendations. I also describe conditions I recommend the Commission  
4 establish for any GIP programs approved, including (1) performance  
5 measurement; (2) cost caps and associated operating audits; and (3) rejection of  
6 cost recovery for assets placed into service in the test year that are not standard  
7 industry practice/not cost effective. I also recommended the Commission reject  
8 deferral accounting because I believe the practice encourages investment in sub-  
9 optimal grid programs. My testimony describes why many GIP programs are  
10 sub-optimal.

11 **Q. DOES THIS CONCLUDE YOUR TESTIMONY?**

12 A. Yes, it does.

CERTIFICATE OF SERVICE

I certify that the parties of record on the service list have been served with the Direct Testimony of Dennis Stephens on Behalf of the North Carolina Justice Center, North Carolina Housing Coalition, Natural Resources Defense Council, and Southern Alliance for Clean Energy either by electronic mail or by deposit in the U.S. Mail, postage prepaid.

This the 13th day of April, 2020.

s/ Gudrun Thompson

Gudrun Thompson
