

STATE OF NORTH CAROLINA  
UTILITIES COMMISSION  
RALEIGH

DOCKET NO. E-7, SUB 1297

BEFORE THE NORTH CAROLINA UTILITIES COMMISSION

In the Matter of:	)	
Application of Duke Energy Carolinas,	)	
LLC for a Certificate of Public	)	
Convenience and Necessity to Construct	)	<b>DIRECT TESTIMONY OF</b>
an 850 MW Natural Gas-Fired	)	<b>WILLIAM B. MCALEB ON</b>
Combustion Turbine Generating Facility	)	<b>BEHALF OF ENVIRONMENTAL</b>
in Catawba County, North Carolina	)	<b>DEFENSE FUND</b>

---

[ REDACTED ]

**TABLE OF CONTENTS**

I. Introduction, Background, Findings, and Recommendations.....3

II. Category 1: Discussion of the Marshall Coal Unit Replacement and Energy  
Combustion Turbine Construction Projects, Need Determination, Project Components,  
and Fuels .....10

III. Category 2: Reasonableness of Costs, Shortcomings and Shortfalls.....19

1 **I. Introduction. Background, Findings, and Recommendations**

2 **Q: PLEASE INTRODUCE YOURSELF, YOUR CURRENT POSITION AND**  
3 **BUSINESS LOCATION.**

4 A: My name is William B. (“Bill”) McAleb, and I am employed as the Chief Executive  
5 Officer and President of Rod Walker & Associates (“RWA”), a Management  
6 Consultancy and Technical Advisory firm based near Atlanta, GA.

7 **Q: PLEASE SUMMARIZE YOUR EXPERIENCE, PROFESSIONAL AND**  
8 **EDUCATIONAL BACKGROUND.**

9 A: I possess over forty years of Oil, Gas, Power and Utility industry experience and  
10 business operational knowledge, engineering, and technical expertise. Having a  
11 well-seasoned range of career executive, management, strategic and operational  
12 experience, I offer leadership, guidance, vision, corporate and board counsel,  
13 interim executive, and expert witness services. The focus of my practice is the  
14 provision of technical, financial, policy and managerial advisory and forensics  
15 services to clients engaged in the nexus between hydrocarbon fuels, electric power,  
16 transmission & distribution, energy and fuels storage, petroleum midstream, inter-  
17 and intrastate pipelines and utilities. Further, I deliver deep experience and hands-  
18 on leadership, implementation, and management relative to operations, financial  
19 and operational performance and optimization, utility and energy policy practices,  
20 process and profitability strategy and innovation. In addition, I have expertise with  
21 respect to M&A/Transactional/Transitional advisory services to financial and  
22 private equity clients as well as strategic advisory services to utility, energy, and  
23 related clients.

1 I have MBA and Master of Petroleum Engineering degrees from Tulane University  
2 and a Bachelor of Chemical Process Metallurgical Engineering from the University  
3 of Texas at El Paso.

4 I have provided expert testimony related to natural gas procurement and prudence,  
5 energy asset property tax issues, RCN analysis, operational joint-interest  
6 agreements and performance, energy market performance and forecasting,  
7 regulatory policy and practices, utility prudence determinations and economic  
8 forensics in state, federal, and regulatory venues.

9 **Q: ON WHOSE BEHALF ARE YOU APPEARING?**

10 A: I am submitting this testimony on behalf of the Environmental Defense Fund.

11 **Q: HAVE YOU EVER TESTIFIED BEFORE A STATE PUBLIC UTILITIES**  
12 **COMMISSION?**

13 A: Yes, I have submitted and/or supported testimony before various state commissions  
14 including The New Orleans City Council's Utility Regulatory Office (the  
15 regulatory agency charged with oversight of Entergy) and the Regulatory  
16 Commission of Alaska, the state of Alaska Petroleum Tax Review and Assessment  
17 Board and the Illinois Commerce Commission. I have previously submitted  
18 testimony before the North Carolina Utilities Commission in Docket No. E-100,  
19 Sub 190.

20 **Q: HAVE YOU PREPARED ANY ATTACHMENTS IN SUPPORT OF YOUR**  
21 **TESTIMONY?**

22 A: Yes. I have included various supporting documents contained in EDF Exhibit A.01  
23 through EDF Exhibit E.01 as identified below.

Exhibit No.	Description
EDF Exhibit A.01	General Electric 7HA Heavy Duty Turbine Specification Sheet
EDF Exhibit B.01	Siemens Energy HL-Class Gas Turbine Specification Sheet
EDF Exhibit C.01	EIA Cost and Performance Characteristics of New Generating Technologies, Annual Energy Outlook 2022
EDF Exhibit D.01	EIA Annual Energy Outlook 2023 Table 55 Overnight Capital Costs for New Generating Plants
EDF Exhibit E.01	Direct Testimony of William McAleb NCUC Docket 100, Sub 190

1

*Table 1: List of Exhibits*2 **Q: WHAT IS THE PURPOSE OF YOUR TESTIMONY?**

3 A: The purpose of my testimony is to review and provide commentary and analysis  
4 regarding the Application of Duke Energy Carolinas, LLC for a Certificate of  
5 Public Convenience and Necessity to construct an 850 MW Natural Gas-Fired  
6 Combustion Turbine Generating Facility in Catawba County, North Carolina  
7 (“Application”). Duke Energy Carolinas, LLC (“DEC”) is proposing to construct  
8 two, advanced-class, hydrogen-capable simple-cycle natural gas combustion  
9 turbine (CT) generation units on the site to the existing Marshall Steam Generation  
10 Facility to replace and retire coal Units 1 and 2. Each of the proposed CT units have  
11 a winter capacity of 425 MW, or a total winter capacity of 850 MW.

12 Specifically, my testimony will:

- 13 • Review and offer comments relative to the pertinent portions of the  
14 Application,
- 15 • Review, highlight, and compare cost and performance data within the  
16 Certificate against publicly available information and datasets to confirm  
17 reasonableness,

- 1           • Cite to any concerns related to cost, emissions, reliability, definition,  
2           potential ratepayer impacts, or other areas of concern related to  
3           foundational issue omissions related to the Application,  
4           • Explain the foundation of any such concerns, and an overview level  
5           discussion related to the Application.

6   **Q: PLEASE SUMMARIZE YOUR FINDINGS, CONCLUSIONS, AND**  
7   **RECOMMENDATIONS.**

8   A: My review and analysis of the Plan has resulted in the following broad conclusions:

- 9           • The Application is supported by and was developed based in substantive part  
10          on analytic investigations performed within the DEC and Duke Energy  
11          Progress, LLC's ("DEP") (DEC and DEP collectively "Duke" or the  
12          "Companies") 2023-2024 Carbon Plan and Integrated Resource Plan  
13          ("CPIRP" or "Plan").  
14          • The exit from coal generation appears to be of primary concern during  
15          reshaping of DEC's power resource transition to reduced emissions through  
16          changing fuels and a greater reliance on renewable resources – the instant  
17          Application focuses on that objective.  
18          • However, DEC's presumption that it will be able to convert new natural gas-  
19          fired assets into low or zero carbon emission, hydrogen-fired assets is not  
20          based on substantive evidence presented in this docket proceeding.  
21          • The issues surrounding hydrogen co-firing, 100% hydrogen fueling, and  
22          infrastructure are not inconsequential. OEM ("original equipment  
23          manufacturers") for combustion turbines have not demonstrated a firm

1 commitment as to when, or even if, 100% hydrogen fueling of combustion  
2 turbines (“CTs”) is technically and economically feasible.

3 • Two of the leading CT manufacturing firms currently have equipment capable  
4 of a 50% hydrogen/natural gas blended fuel, but the delivery of CT equipment  
5 with 100% hydrogen fuel capabilities stands as currently unavailable and only  
6 potentially capable sometime in or after 2030.

7 • A clear commitment from the OEMs is currently lacking with respect to the  
8 timing of a fully compatible 100% hydrogen fired utility scale (“General  
9 Electric model 7HA” and/or “Siemens Energy model SGT6- 9000HL”)  
10 turbine.

11 • Even if the equipment manufacturers can introduce hydrogen-capable turbines  
12 sometime in or after 2030, 100% hydrogen equipment retrofits for the then in-  
13 service turbines will require additional, and currently unknown, costs  
14 associated with the fuel technology implementation.

15 • Due to regional pipeline congestion, TRANSCO Zone 5 area is planned for a  
16 supply enhancement project that DEC have subscribed to on the order of  
17 1,000,000 Dth per day that assures natural gas deliveries for projects like the  
18 proposed Marshall CT facility into the future.

19 • Whether the proposed new Marshall CT facility is a reasonable and necessary  
20 investment made on behalf of ratepayers depends largely on whether the  
21 Marshall CT will be able to continue to provide generation when North  
22 Carolina law requires low or zero emissions by DEC’s in-state generation  
23 resources. As it stands today, presuming a hydrogen-fired, carbon emissions-

1 free Marshall CT facility within the period required by law is not only  
2 speculative but unlikely.

3 **Recommendations:**

4 As a result of the above findings and conclusions, The Commission should not  
5 approve the Application unless it also directs DEC to comply with each of the  
6 following pointed recommendations and in doing so, apply a clear, transparent, and  
7 rigorous statistical and logic-based analysis protocol.

8 **Recommendation 1: 100% Hydrogen Reasonable Demonstration Study**

- 9 • The Commission should require DEC to present:
- 10 ○ The commitments made to DEC by the manufacturers of the  
11 proposed CT units relative to when the units will be 100% hydrogen  
12 capable.
- 13 ○ A detailed timeline explaining when DEC anticipates, based on  
14 substantial evidence, when DEC plans to convert the proposed  
15 Marshall CT to 100% hydrogen firing.
- 16 ○ A detailed and evidence-based analysis showing the DEC perceived  
17 likelihood of a viable hydrogen pipeline supply to the Marshall CT  
18 facility.
- 19 ○ Detail DEC's estimate of retrofit and/or modification costs to  
20 convert the proposed Marshall CT and ancillary "inside the fence"  
21 plant infrastructure and controls to achieve 100% hydrogen capable  
22 generation status.

- 1                   ○ Sourcing and/or generation plus storage costs anticipated for the for  
2                   the proposed Marshall CT.
- 3                   ○ If hydrogen blending utilizing existing methane pipelines in  
4                   unavailable, how will DEC supply hydrogen to the proposed  
5                   Marshall CT?
- 6                   ○ An evidence-based analysis determining the relative costs and  
7                   obstacles to:
- 8                   ▪ Co-located renewable energy and PEM technology, as at  
9                   Duke's DeBary hydrogen co-firing pilot.
- 10                  ▪ Import of hydrogen via non-pipeline means such as train or  
11                  truck.

12                  Recommendation 2: Hydrogen Blending Study

- 13                  • The Commission should require DEC to detail what representations  
14                  and/or commitments from its current gas suppliers it relies upon in  
15                  assuming the availability of hydrogen blended into the existing methane  
16                  pipeline network and addressing safety and feasibility concerns raised  
17                  above.

18                  Recommendation 3: Hydrogen Reasonableness

- 19                  • The Commission should require DEC to present substantial, non-  
20                  speculative evidence on the above 100% hydrogen and hydrogen  
21                  blending issues.

1 **II. Category 1: Discussion of the Marshall Coal Unit Replacement and Energy**  
2 **Combustion Turbine Construction Projects, Need Determination, Project**  
3 **Components, and Fuels**

4 **Q: PLEASE PROVIDE A DISCUSSION OF THE FUTURE OF COAL**  
5 **GENERATION RESOURCES AND HOW THAT FUTURE IS BEING**  
6 **ADDRESSED BY DEC WITH RESPECT TO THE MARSHALL ENERGY**  
7 **COMPLEX.**

8 A: In a 2019 article that appeared in Energy News<sup>1</sup> entitled “*Coal has always been*  
9 *king in the South. Now that’s changing*”, the increasing difficulties in achieving a  
10 positive economic outlook for coal generation resources are discussed. The article  
11 cites that Duke Energy’s “coal fleet is running less and less.” And that “nine of the  
12 company’s 13 coal plants ran less than half the year in 2018.” The article continues  
13 to describe that lower priced natural gas has rendered some of the older, less  
14 efficient coal units less competitive – including those that the Marshall Energy  
15 Complex will replace. Lower gas costs, coupled with the dispatching of more  
16 efficient units, results in the displacement of inefficient coal units from the dispatch  
17 merit stack leading to disappointing operational factors and metrics.

18 DEC frames natural gas as a bridge fuel capable of reducing carbon emissions. The  
19 point of the use of natural gas in the near term is essentially to “buy time” until less  
20 emission-emitting generation technologies and fuels can be proven and constructed  
21 at a scale that can be relied upon for the energy needs of DEC’s service area.

---

<sup>1</sup> [www.energynews.us/2019/10/03/coal-has-always-been-king-in-the-south-now-thats-changing/](http://www.energynews.us/2019/10/03/coal-has-always-been-king-in-the-south-now-thats-changing/) (last checked May 24, 2024).

1 The economic and emission review performed by DEC comparing the proposed  
2 natural gas units to the existing coal generation resources appears to have been the  
3 primary driver of the new generation units to replace two of the old coal units at the  
4 Marshall Steam Facility to the extent that DEC are in the process of obtaining an  
5 approval to replace Units 1 and 2.

6 **Q: ON WHAT BASIS DOES DEC PROPOSE THE DEVELOPMENT OF THE**  
7 **MARSHALL ENERGY COMPLEX PROJECT?**

8 A: The Marshall Steam Center currently consists of four coal-fired generation units,  
9 wherein two of the four units will be replaced with CTs. The Application is a result  
10 of DEC's modeling efforts within the CPIRP and consistent with DEC's plans to  
11 replace inefficient coal generation resources prior to forced retirement in an effort  
12 directed toward transitioning to a progressively cleaner generation emissions  
13 future. The CPIRP is an overarching proposal, not yet approved by the Commission,  
14 focused on the provision of reliable electric service as required under law, which  
15 shapes DEC's transition to a carbon emission free generation stack. The CPIRP  
16 claims as a fundamental tenet an "Orderly Energy Transition" that has four main  
17 objectives - Resource Diversity, a Clean Resource Mix, Least Cost Planning, and  
18 the ability to Execute the Plan with Foreseeable Conditions with an overriding  
19 focus on reliability and the meeting of and compliance with laws and regulations.  
20 The State of North Carolina has a statutory requirement for a 70% reduction in  
21 emissions from 2005 levels in Duke's generation portfolio with an additional  
22 carbon neutrality requirement by 2050. Moreover, according to the CPIRP

1 document, DEC is focused on a “most reasonable, least cost” approach to the North  
2 Carolina emissions reduction requirements.

3 These goals and statutory framework are the basis for the proposed facility.

4 **Q: PLEASE BRIEFLY DISCUSS THE CPIRP MODELING EFFORT THAT**  
5 **DUKE ALLEGES TO DEMONSTRATE THE NEED REQUIRED IN THE**  
6 **APPLICATION.**

7 A: The CPIRP modeling effort identified a need for 2,125 MW of new CT capacity  
8 within the period 2028-2031,<sup>2</sup> of which 850 MW of CT resource capacity is  
9 proposed to be provided by the Marshall Energy Complex.

10 **Q: PROVIDE A DESCRIPTION OF MARSHALL ENERGY COMPLEX**  
11 **PROJECT THAT IS SCHEDULED TO BE ONLINE IN 2029.**

12 A: The proposed Marshall Energy Complex project is a new, “hydrogen capable,”  
13 advanced-class, combustion turbine (in a simple-cycle configuration) plant. DEC  
14 is proposing to construct two, advanced-class, “hydrogen-capable” simple-cycle  
15 natural gas combustion turbine generation units on a site about 1.25 miles from the  
16 existing Marshall Steam Station site to replace and retire coal units 1 and 2. The  
17 CTs being offered by the OEM manufacturers are 50% hydrogen capable with  
18 potential of being 100% capable by or after 2030. Further, the CTs are “advanced-  
19 class” potentially pointing to enhanced performance specifications and lower  
20 emissions, lower heat rates, and exceptional ramp rates. Each of the proposed CT

---

<sup>2</sup> *Direct Testimony of Michael Quinto*, Docket No. E-7, Sub 1297 p. 7

1 units have a winter capacity of 425 MW, for a Marshall Energy Complex winter  
2 capacity of 850 MW for the two gas CTs.

3 **Q: WHAT CONCERNS DO YOU HAVE WITH THE PROPOSED**  
4 **COMBUSTION TURBINE COMPONENTS?**

5 A: In general, there are only two or three OEM companies that manufacture utility  
6 scale CTs that are “advanced class” and 50% hydrogen fuel capable. This fact is  
7 confirmed by DEC who state: “The Companies received bids from all three CT  
8 manufacturers, i.e., General Electric Vernova, Siemens Energy, and Mitsubishi  
9 Power Americas, Inc[...].”<sup>3</sup>

10 **Q. HAS DEC IDENTIFIED THE CT EQUIPMENT THEY PLAN TO**  
11 **INSTALL?**

12 A. Not in a firm manner, however two of the companies, Siemens Energy and General  
13 Electric, specification sheets are included as Exhibits EDF-A.01 and EDF-B.01.  
14 Because both simple- and combined-cycle CT configurations are presented in these  
15 Exhibits and because DEC have recent experience with a new Siemens SGT-  
16 9000HL facility at Lincoln County, North Carolina, there is a reasonable potential  
17 that one of the two OEMs presented here will likely be selected to supply the CT  
18 equipment for the Marshall Energy Complex CPCN.  
19 DEC has not publicly identified the specific CTs it plans to use for the project but  
20 has provided some of the features it plans for the selected CTs. The planned CTs  
21 will be “advanced-class, hydrogen-capable” utility scale CTs. These features also

---

<sup>3</sup> *Direct Testimony of Bobby Smith*, Docket No. E-7, Sub 1297, p. 17.

1 appear to support the conclusion that one of the two OEMs above will be the  
2 equipment vendor for the Marshall facility.

3 **Q: WHAT IS MEANT BY “HYDROGEN CAPABLE” AND WHAT ARE YOUR**  
4 **CONCERNS WITH THE ROUTINE USE OF HYDROGEN AS A CT FUEL?**

5 A: The focus of the OEMs of the CTs is to respond to market wants for a CT that can  
6 utilize, initially, a 50% blend of hydrogen and natural gas as fuel, with an aspiration  
7 of 100% hydrogen. The CTs being offered by the OEM manufacturers claim to be  
8 50% hydrogen capable with potential of being 100% capable by or after 2030.  
9 Further, the CTs are described as being “advanced-class,” potentially pointing to  
10 enhanced performance specifications and lower emissions (2 ppm NO<sub>x</sub> – 10ppm  
11 CO<sub>2</sub>), lower heat rates (7,884 Btu/kWh), and exceptional ramp rates (75 to 85  
12 MW/minute).

13 The use of hydrogen as a routine fuel, however, is burdened with uncertainties.  
14 Many of which will require new technological advancements with respect to the  
15 handling, storage, and transportation of hydrogen fuel and whether a robust  
16 hydrogen marketplace will develop to provide those services.

17 Moreover, technological strides are also necessary within hydrogen production  
18 wherein the production of hydrogen will need to utilize as much emission-free  
19 energy as possible to address and be compliant with the State of North Carolina’s  
20 statutory requirement for a 70% reduction in emissions from 2005 levels with an  
21 additional carbon neutrality requirement of 2050. Simply using grid power to  
22 produce hydrogen does not automatically mean that the facilities are now inherently

1 low-emissions and the lifecycle emissions of the hydrogen burned must be  
2 considered – not just the combustion emissions.

3 **Q: WHAT IS MEANT BY ADVANCED-CLASS AND WHAT ARE THE**  
4 **POTENTIAL IMPLICATIONS FOR IMPROVED PERFORMANCE?**

5 A: The term “advanced class” with respect to CTs is not defined in the Application.  
6 After a review of publicly available specification documents from the probable  
7 OEMs, the likely performance improvements that could support this idea of  
8 “advanced class” designation are fairly clear. For example, the Siemens Energy HL-  
9 class gas turbine specification sheet displays several significant changes and/or  
10 upgrades to the HL-class CT.<sup>4</sup>

11 The improvements include:

- 12 • Higher efficiency turbine blades
- 13 • Advanced combustion system (higher firing temperatures and operation  
14 flexibility)
- 15 • Improved blade cooling characteristics and features
- 16 • Improved air leakage sealing
- 17 • Larger turbine blades that enhance power output

18 In addition, improved performance metrics also may contribute to an “advanced  
19 class” designation:

- 20 • Enhanced Ramp-up – 85 MW/Minute
- 21 • Improved Heat Rate - <7,898 Btu/kWh

---

<sup>4</sup> EDF Exhibit B.01.

- 1 • NOx emission – 2-25 ppm (with/without SCR)
- 2 • CO emission – 10 ppm

3 DEC in the Application states that an annual emission reduction of NOx by 82%,  
4 SO2 by 92%, and CO2 by 40% per MWh is planned.<sup>5</sup> However, it is not clear if  
5 there is an additional cost for the 50% hydrogen current capability or whether there  
6 will be a retrofitting cost if and when the CTs potentially become 100% hydrogen  
7 capable in the future. The “advanced class” designation appears to be solely tied to  
8 the improvements to current technology and not newly developed technology as it  
9 relates to blended or full hydrogen combustion. Therefore, DEC use of the  
10 “advanced class” refers to improvements to a natural gas CT and not hydrogen  
11 combustion.

12 **Q. IS THE ISSUE OF FUEL DELIVERY AND AVAILABILITY DISCUSSED**  
13 **WITHIN THE CPIRP OR THE CPCN?**

14 A. Yes, the Application discusses that natural gas supplies are currently delivered to  
15 the Marshall Steam Facility and will prospectively be delivered to the Marshall  
16 Energy Complex facility once completed by Piedmont Natural Gas Company, Inc.  
17 (“Piedmont”), an affiliate of DEC and an intrastate pipeline that provides redelivery  
18 services to the Marshall Facility. Natural gas to be delivered is currently (and will  
19 be in the future) sourced from Piedmont’s interconnection with the Transcontinental  
20 Pipeline (“TRANSCO”), an interstate pipeline under Federal Energy Regulatory  
21 Commission (“FERC”) jurisdiction and regulatory oversight, in Zone 5.

---

<sup>5</sup> *Direct Testimony of John Robert Smith*, Docket No. E-7, Sub 1297 p. 7

1 **Q: DO SUFFICIENT AND AVAILABLE NATURAL GAS VOLUMES EXIST**  
2 **WITHIN TRANSCO'S ZONE 5 TO ENSURE THE DELIVERY OF**  
3 **RELIABLE FIRM QUANTITIES OF NATURAL GAS SUPPLIES TO THE**  
4 **MARSHALL ENERGY COMPLEX INTO THE FUTURE?**

5 A: Natural gas supplies within the TRANSCO Zone 5 are currently constricted<sup>6</sup> and  
6 as a result, excess or additional natural gas volume requests for firm service are  
7 largely being denied. TRANSCO has recognized this constrained situation and, on  
8 February 1, 2024, filed with the FERC a request<sup>7</sup> for approval of a southeast supply  
9 enhancement project to expand its ability to supply additional volumes of natural  
10 gas to shippers within the TRANSCO Zone 5 area.<sup>8</sup> DEC has already subscribed to  
11 1,000,000 Dth per day of transportation capacity to the new TRANSCO Southeast  
12 Supply Enhancement Project The proposed in-service date of the Project is  
13 November 1, 2027 which allows ample time to be in service prior to the firm gas  
14 volume need for the Marshall Energy Complex. It is unlikely that the proposed  
15 TRANSCO supply enhancement project will not be approved by the FERC.

16 **Q: PLEASE HIGHLIGHT SOME OF THE POTENTIAL TECHNOLOGICAL**  
17 **CHANGES THAT ARE OF CONCERN.**

18 A: Some of the long-lead and/or nascent technology concerns that I have identified  
19 include:

20 1. OEM manufacturers of CTs have not demonstrated a firm commitment as to  
21 when, or even if, hydrogen fueling of CTs is technically and economically

---

<sup>6</sup> EDF Exhibit E.01 Transcontinental Pipe Line Company Southeast Supply Enhancement

<sup>7</sup> Id.

<sup>8</sup> Id.

1 feasible to deliver on the promise of 100% hydrogen capable equipment.  
2 According to two of the leading OEM CT manufacturing firms (i.e., Siemens  
3 and GE), utility scale CTs are currently capable of a 50% hydrogen/natural gas  
4 blended fuel, but the delivery of CT equipment with 100% hydrogen fuel  
5 capabilities stands as currently unavailable and only potentially capable  
6 sometime in or after 2030.<sup>9</sup> Moreover, there are a myriad of other technical  
7 hurdles related to the use of hydrogen as a primary CT fuel, coupled with  
8 hydrogen production, storage, transport, and infrastructure issues are discussed  
9 further as a separate set of topics later in this testimony.

10 2. There is no clear commitment as to timing of a fully compatible 100% hydrogen  
11 fired utility scale (General Electric model 7HA and/or Seimens Energy model  
12 SGT6-9000HL) turbine at this time. Both equipment manufacturers discussed  
13 earlier have indicated a target date for this technology sometime during 2030 or  
14 beyond.

15 3. Even if the equipment manufacturers are able to introduce hydrogen-capable  
16 turbines sometime in 2030 and are able to introduce 100% hydrogen equipment  
17 retrofits for the then in-service turbines, there will be additional currently  
18 unknown costs associated with the technology implementation. The installation  
19 of the retrofit equipment and additional labor and likely ancillary equipment  
20 and controls costs which will impact ratepayers above and beyond the current  
21 generator replacements, in the future. This unknown ratepayer cost impact

---

<sup>9</sup> Exhibits EDF-A.01 and EDF-B.01

1 would be based on decisions made today that have future, unknown rate  
2 consequences due to their reliance on this emerging technology. DEC did not  
3 account for this in their Plan.

4 **III. Category 2: Reasonableness of Costs, Potential Shortfalls and**  
5 **Recommendations**

6 **Q: WITH RESPECT TO PROJECT COST, HAVE YOU HAD THE**  
7 **OPPORTUNITY TO REVIEW DEC'S CONFIDENTIAL COST**  
8 **INFORMATION IN EXHIBIT 3 TO THE CPCN?**

9 A: Yes, I have reviewed and compared the data included in Exhibit 3 to publicly  
10 available similar Energy Information Administration data.

11 **Q: WHAT METHOD DID YOU USE TO DETERMINE REASONABLENESS**  
12 **RELATED TO THE MARSHALL ENERGY COMPLEX AS PROVIDED IN**  
13 **EXHIBIT 3 TO THE CPCN APPLICATION?**

14 A: My review of the cost information provided in Exhibit 3 consisted of a comparison  
15 of the costs presented with publicly available information from the U.S. Energy  
16 Information Administration ("EIA"). The information utilized is contained within  
17 the attached exhibits EDF Exhibit C.01 and EDF Exhibit D.01. Both of these  
18 exhibits utilize data that is collected by the EIA from a variety of sources and is  
19 then published in the EIA Annual Energy Outlook ("AEO") documents as "our  
20 assessment of the cost to develop and install various generating technologies used  
21 in the electric power sector." The data include within these documents are not  
22 absolute. According to the EIA documents "All technologies demonstrate some  
23 degree of variability in cost, based on project size, location, and access to key

1 infrastructure...” Thus, the data is useful in a general determination of  
2 reasonableness.

3 The CTs selected by DEC are characterized as advanced-class and “hydrogen  
4 capable”, they represent the next generation in CTs. Since they are the latest next  
5 generation, the CTs planned for the Marshall Energy Complex CPCN are not a  
6 perfect match for the historic data included within EIA AOE documents and two  
7 different CT technologies were selected from the data for comparative  
8 reasonableness purposes. This selection of technologies developed a range of costs  
9 and performance operating characteristics that could be used to support a finding  
10 of reasonableness.

11 The technologies selected for comparison to the proposed project CTs was selected  
12 based on the general size, cycle performance, and the likelihood of similar  
13 operational performance. The selected technology for comparison were Industrial  
14 Frame Combustion Turbines and Combined Cycle Single Shaft Turbines. The  
15 Industrial Frame Turbine represented the lower limit of overnight capital costs  
16 while the Combined Cycle Single Shaft Turbine represents the upper range limit.  
17 Similarly, the Combined Cycle Single Shaft Turbine data was weighted more  
18 because of the combined cycle performance fit with the advanced-class designation  
19 of the proposed CT aspect and because the average size of the Combined Cycle  
20 Single Shaft Turbines in the EIA data was more closely that of the instant CPCN  
21 project.

1 Q: WHAT ARE YOUR CONCLUSIONS RELATED TO THE COST OF  
2 MARSHALL ENERGY COMPLEX AS PROVIDED IN EXHIBIT 3 TO THE  
3 CPCN APPLICATION?

4 A: [BEGIN CONFIDENTIAL] [REDACTED]  
5 [REDACTED]  
6 [REDACTED]  
7 [REDACTED]  
8 [REDACTED]  
9 [REDACTED]  
10 [REDACTED]  
11 [REDACTED]  
12 [REDACTED]  
13 [REDACTED]  
14 [REDACTED]  
15 • [REDACTED]  
16 [REDACTED]  
17 [REDACTED] [END CONFIDENTIAL]

18 The costs associated with the instant Marshall Energy Complex CPCN as a result  
19 of the above comparison, is reasonable. However, the costs assumptions do not  
20 solve the bridge to a hydrogen-firing facility required to meet the carbon emissions  
21 reductions requirements.

1 **Q: IN YOUR VIEW, ARE THERE ANY FURTHER AREAS OF CONCERN,**  
2 **QUESTIONS, OR RECOMMENDATIONS TO THE COMMISSION THAT**  
3 **SHOULD BE HIGHLIGHTED?**

4 A: Yes, there are a few areas to highlight and discuss, as follows:

5 The Commission should direct DEC to apply a clear, transparent, and rigorous  
6 analysis and commentary to each of the following pointed recommendations.

7 • DEC states in the Application that: “the Proposed Facility will be... more flexible,  
8 efficient and have higher ramp rates and lower turndown than DEC’s existing F-  
9 class CTs.”<sup>11</sup> but fail to explain:

10 ○ The efficiencies and other benefits associated with the term “advanced-  
11 class”;

12 ○ Whether the cost of the proposed CTs is enhanced as a result of them being  
13 “hydrogen-capable”;

14 ○ What are the CT component and ancillary equipment requirements, costs,  
15 and potential timing associated with the retrofitting of the CTs to 100%  
16 hydrogen capable;

17 ○ The anticipation of capacity factor;

18 ○ Capacity forecasts; and

19 ○ Discussion of ramp rates and turndown rates, coupled with the implication  
20 on normal operations.

---

<sup>11</sup> Application, p. 8.

1       • With respect to the statement “The Proposed Facility is projected to operate as a  
2       peaking resource, with generally low utilization factors, but its dispatchable  
3       capacity is critically important to achieving DEC’s target 22% planning reserve  
4       margin...<sup>12</sup>; what is the basis for DEC’s level of necessary reserve margin? Is the  
5       reserve margin level a result of “... operational impacts from an increase in variable  
6       renewable generation necessitate additional dispatchable generation  
7       resources...”<sup>13</sup>

8       **Q: DOES THIS CONCLUDE YOUR TESTIMONY?**

9       **A:** Yes, it does.
