

STATE OF NORTH CAROLINA  
UTILITIES COMMISSION  
RALEIGH

DOCKET NO. E-7, SUB 1282

BEFORE THE NORTH CAROLINA UTILITIES COMMISSION

In the Matter of	)	
Application of Duke Energy Carolinas, LLC	)	<b>DIRECT TESTIMONY OF</b>
Pursuant to G.S. 62-133.2 and NCUC Rule	)	<b>JOHN D. SWEZ</b>
R8-55 Relating to Fuel and Fuel-Related	)	<b>DUKE ENERGY CAROLINAS, LLC</b>
Charge Adjustments for Electric Utilities	)	

---

1 **Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

2 A. My name is John D. Swez, and my business address is 526 S. Church Street,  
3 Charlotte, North Carolina 28202.

4 **Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?**

5 A. I am employed as Managing Director, Trading and Dispatch, by Duke Energy  
6 Carolinas, LLC (“Duke Energy Carolinas,” “DEC,” or the “Company”). In that  
7 capacity, I lead the organization responsible for Power Trading on behalf of Duke  
8 Energy’s regulated utilities including DEC and Duke Energy Progress, LLC  
9 (“DEP”) (collectively, the “Companies”), as well as generation dispatch on  
10 behalf of Duke Energy’s regulated utilities in Indiana, Ohio, and Kentucky.

11 **Q. PLEASE SUMMARIZE YOUR EDUCATIONAL AND PROFESSIONAL**  
12 **EXPERIENCE.**

13 A. I received a Bachelor of Science degree in Mechanical Engineering from  
14 Purdue University in 1992. I received a Master of Business Administration  
15 degree from the University of Indianapolis in 1995. I joined PSI Energy, Inc. in  
16 1992 and have held various engineering positions with the Company or its  
17 affiliates in the generation dispatch or power trading departments. In 2003, I  
18 assumed the position of Manager, Real-Time Operations. On January 1, 2006, I  
19 became the Director of Generation Dispatch and Operations with responsibility  
20 for (i) generation dispatch; (ii) unit commitment; (iii) 24-hour real-time  
21 operations; and (iv) plant communications related to short-term generation  
22 maintenance planning for Duke Energy’s regulated utilities in Indiana, Ohio, and  
23 Kentucky. During the period 2010-2017, I also managed the DEC Generation  
24 Dispatch function. I assumed my current role on November 1, 2019. Finally, I am

1 a registered Professional Engineer licensed in the States of North Carolina and  
2 Indiana.

3 **Q. HAVE YOU TESTIFIED BEFORE THIS COMMISSION IN ANY PRIOR**  
4 **PROCEEDING?**

5 A. Yes. I testified in support of DEP's 2021 fuel and fuel-related cost recovery  
6 application in Docket No. E-2, Sub 1272.

7 **Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY IN THIS**  
8 **PROCEEDING?**

9 A. The purpose of my testimony is to describe DEC's fossil fuel purchasing practices,  
10 provide actual fossil fuel costs for the period January 1, 2022 through December  
11 31, 2022 ("test period") versus the period January 1, 2021 through December 31,  
12 2021 ("prior test period"), and describe changes projected for the billing period of  
13 September 1, 2023 through August 31, 2024 ("billing period"). Additionally, I  
14 will discuss the proposed changes to the fuel cost proxy percentage calculation  
15 used to approximate the actual fuel cost component of a power purchase when the  
16 actual fuel cost component is unavailable or unidentified as a component of the  
17 price paid for energy under a power purchase contract.

18 **Q. PLEASE EXPLAIN WHY THE COMPANY IS PROPOSING A CHANGE**  
19 **TO THE FUEL COST PROXY PERCENTAGE CALCULATION.**

20 A. The most recent proxy percentage was established during the 2008 fuel  
21 proceeding, through an analysis of off-system sales from calendar year 2007.  
22 Since the 2008 fuel proceeding, the proxy has not been updated. Due to increasing  
23 fuel commodity prices and a changing resource mix, the Company and the Public  
24 Staff have agreed that the fuel proxy established in the 2008 fuel proceeding no

1 longer represents a reasonable approximation of the fuel cost portion of power  
2 purchases 14 years later. Furthermore, both the Company and the Public Staff  
3 consider it reasonable to continue to use the accepted methodology of using the  
4 fuel component of the Companies' off-system sales as a reasonable basis for  
5 approximating fuel costs associated with power purchases when actual fuel costs  
6 are unavailable or unidentified as a component of the price paid for energy under  
7 a power purchase contract. Therefore, the Company and the Public Staff have  
8 reached agreement that, per the attached Stipulation (Swez Exhibit 4), for future  
9 fuel proceedings starting with the Company's 2023 annual fuel rider proceeding,  
10 an annual compilation of actual total fuel and fuel-related costs as a component of  
11 total short-term off-system sales revenue is an appropriate basis for estimating fuel  
12 costs on power purchases when the actual fuel component is unavailable or  
13 unidentified as a component of the price paid for energy under a power purchase  
14 contract.

15 **Q. PLEASE EXPLAIN THE CHANGE IN THE FUEL COST PROXY**  
16 **PERCENTAGE CALCULATION**

17 A. For the Company's annual fuel rider proceedings filed during 2023 through 2027,  
18 if actual fuel cost for a power purchase is unavailable or the fuel cost component  
19 is unidentified under a power purchase contract, the Company shall assume that  
20 the fuel cost was in a range between 75% to 85%, the exact percentage to be  
21 determined by the parties beginning with a composite calendar year 2022 review  
22 of short-term off-system sales, inclusive of Southeast Energy Exchange Market  
23 ("SEEM") sales (applied to the test year purchases under review in 2023 fuel  
24 proceedings) through a composite calendar year 2026 review of short-term off-

1 system sales (applied to the test year purchases under review in 2027 fuel  
2 proceedings). The Company will propose a composite total fuel cost to total  
3 energy cost ratio, based on DEC's and DEP's combined short-term off-system  
4 sales for the calendar year. Such composite, in accordance with the terms of the  
5 Stipulation, shall be no greater than 85%, but no less than 75%. For each of the  
6 above-specified fuel proceeding test years, the Company will assess the prior  
7 calendar year composite proxy percentage to be used by both DEC and DEP,  
8 consistently for the full test periods of the subsequent annual fuel rider proceeding,  
9 despite the three-month difference in end date between DEC's and DEP's twelve-  
10 month test periods. To the extent that the analysis of annual composite short-term  
11 off-system sales indicates that the actual fuel and fuel-related component of such  
12 sales revenue falls outside the range of 75% to 85%, the composite proxy  
13 percentage will be adjusted accordingly to reflect either the minimum or  
14 maximum of the range.

15 **Q. HAS THE COMPANY AND THE PUBLIC STAFF REACHED A**  
16 **STIPULATION IN THIS MATTER?**

17 A. Yes, as of January 5, 2023, the Company and the Public Staff entered into a  
18 Stipulation Regarding the Proper Methodology for Determining the Fuel Costs  
19 Associated with Power Purchases from Power Marketers and Others. The  
20 executed Stipulation is attached as Swez Exhibit 4.

21 **Q. YOUR TESTIMONY INCLUDES FOUR EXHIBITS. WERE THESE**  
22 **EXHIBITS PREPARED BY YOU OR AT YOUR DIRECTION AND**  
23 **UNDER YOUR SUPERVISION?**

1 A. Yes. These exhibits were prepared at my direction and under my supervision, and  
2 consist of Swez Exhibit 1, which summarizes the Company's Fossil Fuel  
3 Procurement Practices, Swez Exhibit 2, which summarizes total monthly natural  
4 gas purchases and monthly contract and spot coal purchases for the test period and  
5 prior test period, and Swez Confidential Exhibit 3, which summarizes the annual  
6 fuels related transactional activity between DEC and Piedmont Natural Gas  
7 Company, Inc. ("Piedmont") for spot commodity transactions during the test  
8 period, as required by the Merger Agreement between Duke Energy and  
9 Piedmont. Swez Exhibit 4 sets out the executed Stipulation between the Public  
10 Staff and the Company entered into January 5, 2023.

11 **Q. PLEASE PROVIDE A SUMMARY OF DEC'S FOSSIL FUEL**  
12 **PROCUREMENT PRACTICES.**

13 A. A summary of DEC's fossil fuel procurement practices is set out in Swez Exhibit  
14 1.

15 **Q. PLEASE DESCRIBE THE COMPANY'S APPROACH TO UNIT**  
16 **COMMITMENT AND DISPATCH OF ITS GENERATION ASSETS TO**  
17 **RELIABLY AND ECONOMICALLY SERVE ITS CUSTOMERS.**

18 A. Both DEC and DEP perform the same detailed daily process to determine the unit  
19 commitment plan that economically and reliably meets the Company's projected  
20 system needs over the next seven days. The Company utilizes a production cost  
21 model to determine an optimal unit commitment plan to economically and reliably  
22 meet system requirements. The model minimizes the production costs needed to  
23 serve the projected customer demand within reliability and other system  
24 constraints over a period of time. Inputs to the model include, but are not limited

1 to, the following: (1) forecasted customer energy demand; (2) the latest forecasted  
2 fuel prices, reflective of market supply chain dynamics; (3) variable transportation  
3 rates; (4) planned maintenance and refueling outages at the generating units; (5)  
4 generating unit performance parameters; (6) reliability constraints such as units  
5 run to maintain day-ahead planning reserves or units required to run for  
6 transmission or voltage support; (7) expected market conditions associated with  
7 power purchases and off-system sales opportunities; and (8) projected variable  
8 renewable resource contributions (i.e. solar). The production cost model produces  
9 the optimized hourly unit commitment plan for the 7-day forecast period. This unit  
10 commitment plan also provides the starting point for dispatch, but dispatch is then  
11 also subject to real time adjustments due to changing system conditions, including  
12 management of natural gas transportation constraints. The unit commitment plan  
13 is prepared daily and adjusted, as needed, throughout any given day to respond to  
14 changing real time system conditions.

15 **Q. PLEASE DESCRIBE THE COMPANY'S DELIVERED COST OF COAL**  
16 **AND NATURAL GAS DURING THE TEST PERIOD.**

17 A. The Company's average delivered cost of coal per ton for the test period was  
18 \$99.86 per ton, compared to \$78.22 per ton in the prior test period, representing  
19 an increase of approximately 28%. The cost of delivered coal includes an average  
20 transportation cost of \$33.65 per ton in the test period, compared to \$31.68 per ton  
21 in the prior test period, representing an increase of approximately 6%. The  
22 Company's average price of gas purchased for the test period was \$6.94 per  
23 Million British Thermal Units ("MMBtu"), compared to \$4.22 per MMBtu in the  
24 prior test period, representing an increase of approximately 65%. The cost of gas

1 is inclusive of gas supply, transportation, storage and financial hedging.

2 DEC's coal burn for the test period was 3.2 million tons, compared to a  
3 coal burn of 5.3 million tons in the prior test period, representing a decrease of  
4 40%. The Company's natural gas burn for the test period was 253.5 million MBtu,  
5 compared to a gas burn of 189.6 million MBtu in the prior test period, representing  
6 an increase of approximately 34%.

7 Changes in coal and natural gas burns were primarily driven by the  
8 relationship of coal commodity prices during 2022 relative to natural gas prices in  
9 the same period, as record high coal commodity prices off-set higher natural gas  
10 costs, reducing gas to coal generation switching especially at the Company's dual  
11 fuel operating ("DFO") stations.

12 **Q. PLEASE DESCRIBE THE LATEST TRENDS IN COAL AND NATURAL**  
13 **GAS MARKET CONDITIONS.**

14 A. Coal markets continue to experience a high degree of market volatility due to a  
15 number of factors, including: (1) the inability of coal suppliers to respond to  
16 increasing demand over 2021 and 2022, following the prior years of steep  
17 declines in coal generation demand; (2) natural gas price volatility; (3)  
18 continued uncertainty regarding proposed and imposed U.S. Environmental  
19 Protection Agency ("EPA") regulations for power plants; (4) increased demand  
20 in global markets for both steam and metallurgical coal; (5) tightened access to  
21 investor financing; (6) continued shifts in production from thermal to  
22 metallurgical coal as producers move away from supplying declining electric  
23 generation to take advantage of increasing demand from industry; and, (7)  
24 continued labor and resource constraints further limiting suppliers' operational

1 flexibility. In addition, the coal supply chain experienced significant challenges  
2 throughout 2021 and 2022 as historically low utility stockpiles combined with  
3 rapidly increasing demand for coal, both domestically and internationally, made  
4 procuring additional coal supply increasingly challenging. Producers were  
5 largely unable to respond to this rapid rise in demand due to capacity constraints  
6 resulting from labor and resource shortages. These factors combined to drive  
7 both domestic and export coal prices to record levels by late 2021 and limited  
8 coal supply availability. Continued labor and resource constraints, including the  
9 on-going threat of a rail strike in Q4 2022, caused prices to remain elevated over  
10 the course of 2022. Going into winter 2022 (Dec '22-Feb '23), coal commodity  
11 costs remained at historically high levels as rising production costs and  
12 expectations of continued short-term domestic and foreign demand from higher  
13 natural gas prices continue to put pressure on coal production. Despite current  
14 market conditions, coal producers are seeing the inflationary impacts of rising  
15 costs associated with mining operations including, but not limited to, labor and  
16 equipment costs putting additional pressure on their ability to respond to changes  
17 in market demand.

18 Long-term declines in demand for coal in the utility sector has also  
19 driven rail transportation providers to modify their business models to be less  
20 dependent on coal related transportation revenues. Although rail transportation  
21 providers are required to provide rail service, the Company's rail transportation  
22 providers have limited resources to adapt to significant changes in scheduling  
23 demand resulting from the Company's burn volatility, specifically in higher than  
24 forecasted coal burn scenarios. In 2021 and 2022, the Company experienced

1 escalated delivery delays created by rail transportation labor and resource  
2 shortages, increasing the average cycle time from mine to plant and decreasing  
3 actual rail deliveries versus scheduled deliveries by approximately 30%.

4 With respect to natural gas, the nation's natural gas supply has grown  
5 significantly over the last several years as producers enhanced production  
6 techniques, enhanced efficiencies, and lowered production costs. Natural gas  
7 prices are reflective of the dynamics between supply and demand factors, and in  
8 2021 and 2022, such dynamics were influenced primarily by growth in export  
9 demand, stable production, lower than average storage inventory balances and  
10 seasonal weather demand. Gas production's slow response to rising prices and  
11 the uncertainty of future coal deliveries placed continued stress on gas storage  
12 replenishment through much of 2022, keeping upward pressure on gas prices into  
13 the latter half of 2022. However, beginning in January 2023, moderate weather,  
14 increasing inventory storage balances and growing production have caused natural  
15 gas prices to sharply decline.

16 There is a growing need for natural gas pipeline infrastructure, as gas  
17 production—particularly in low-cost regions such as Appalachia—is constrained  
18 as pipeline infrastructure permitting and regulatory process approval efforts are  
19 increasingly challenged, delaying planned pipeline construction and  
20 commissioning timing.

21 Over the longer-term planning horizon, natural gas supply has the ability  
22 to respond to changing demand while the pipeline infrastructure needed to move  
23 the growing supply to meet demand related to power generation, liquefied natural  
24 gas exports and pipeline exports to Mexico is highly uncertain.

1    **Q.    WHAT ARE THE PROJECTED COAL AND NATURAL GAS**  
2    **CONSUMPTIONS AND COSTS FOR THE BILLING PERIOD?**

3    A.    Based on the most recently completed forecast for use in this filing, which used  
4    market prices as of January 12, 2023, DEC's coal burn projection for the billing  
5    period is 3.7 million tons, compared to 3.2 million tons consumed during the test  
6    period. DEC's billing period projections for coal generation may be impacted due  
7    to changes from, but not limited to, the following factors: (1) delivered natural gas  
8    prices versus the average delivered cost of coal; (2) volatile power prices; and (3)  
9    electric demand. Combining coal and transportation costs, DEC projects average  
10   delivered coal costs of approximately \$105.86 per ton for the billing period  
11   compared to \$99.86 per ton in the test period. This increase in delivered costs is  
12   primarily driven by increased coal commodity costs due to limited coal supply  
13   and increased domestic and international demand. This includes an average  
14   projected total transportation cost of \$30.48 per ton for the billing period,  
15   compared to \$33.65 per ton in the test period. This projected delivered cost,  
16   however, is subject to change based on, but not limited to, the following factors:  
17   (1) exposure to market prices and their impact on open coal positions; (2) the  
18   amount of Central Appalachian coal DEC is able to purchase and deliver and the  
19   non-Central Appalachian coal DEC is able to consume; (3) changes in  
20   transportation rates; (4) performance of contract deliveries by suppliers and  
21   railroads which may not occur despite DEC's strong contract compliance  
22   monitoring process; and (5) potential additional costs associated with suppliers'  
23   compliance with legal and statutory changes, the effects of which can be passed  
24   on through coal contracts.

1           DEC's current natural gas burn projection for the billing period is  
2           approximately 260.9 million MBtu, which is an increase from the 253.5 million  
3           MBtu consumed during the test period. The current average forward Henry Hub  
4           price for the billing period is \$3.99 per MMBtu, compared to \$6.64 per MMBtu  
5           in the test period. Projected natural gas burn volumes will vary on factors such as,  
6           but not limited to, changes in actual delivered fuel costs and weather driven  
7           demand.

8           The net increase in DEC's overall burn projections for the billing period  
9           versus the test period is primarily driven by increases in projected load over the  
10          period.

11   **Q.   WHAT STEPS IS DEC TAKING TO ENSURE A COST-EFFECTIVE**  
12   **RELIABLE FUEL SUPPLY?**

13   A.   The Company continues to maintain a comprehensive coal and natural gas  
14   procurement strategy that has proven successful over the years in limiting average  
15   annual fuel price changes while actively managing the dynamic demands of its  
16   fossil fuel generation fleet in a reliable and cost effective manner. With respect to  
17   coal procurement, the Company's procurement strategy includes: (1) having an  
18   appropriate mix of term contract and spot purchases for coal; (2) staggering coal  
19   contract expirations in order to limit exposure to forward market price changes;  
20   and (3) diversifying coal sourcing as economics warrant, as well as working with  
21   coal suppliers to incorporate additional flexibility into their supply contracts. The  
22   Company conducts spot market solicitations throughout the year to supplement  
23   term contract purchases, taking into account changes in projected coal burns and  
24   existing coal inventory levels. Additionally, the Company negotiates coal

1 transportation contracts that support secure, reliable deliveries. As of July 1, 2022,  
2 the Company has implemented the Fuels and Related Equipment and Services  
3 Management and Supply Agreement (the “DECFM Agreement”) between DEC  
4 and DEP, meaning DEC is the commercial face to the market for coal, reagents,  
5 and related transportation in the Carolinas. This agreement provides for an  
6 increasingly flexible fuel procurement strategy along with increased real-time  
7 logistical flexibility resulting in increased operational and cost efficiencies for  
8 customers.<sup>1</sup>

9 The Company has implemented natural gas procurement practices that  
10 include periodic Request for Proposals and shorter-term market engagement  
11 activities to procure and actively manage a reliable, flexible, diverse, and  
12 competitively priced natural gas supply. These procurement practices include  
13 contracting for volumetric optionality in order to provide flexibility in responding  
14 to changes in forecasted fuel consumption. DEC continues to maintain a short-  
15 term financial natural gas hedging plan to manage fuel cost risk for customers via  
16 a disciplined, structured execution approach. DEC monitors and make  
17 adjustments as necessary to its natural gas hedging program to ensure it remains  
18 appropriate based on market conditions and the Company’s fuel procurement  
19 strategy.

20 Lastly, DEC procures long-term firm interstate and intrastate  
21 transportation to provide natural gas to their generating facilities. Given the  
22 Company’s limited amount of contracted firm interstate transportation, the

---

<sup>1</sup> North Carolina Utilities Commission Docket No. E-7, Sub 1258 & Docket No. E-2, Sub 1282 Order Accepting Affiliate Agreement issued January 24, 2022.

1 Company purchases shorter term firm interstate pipeline capacity as available  
2 from the capacity release market. The Company's firm transportation ("FT")  
3 provides the underlying framework for the Company to manage the natural gas  
4 supply needed for reliable cost-effective generation. First, it allows the Company  
5 access to lower cost natural gas supply from Transco Zone 3 and Zone 4 and the  
6 ability to transport gas to Zone 5 for delivery to the Carolinas' generation fleet.  
7 Second, the Company's FT allows it to manage intraday supply adjustments on  
8 the pipeline through injections or withdrawals of natural gas supply from storage,  
9 including on weekends and holidays when the gas markets are closed. Third, it  
10 allows the Company to mitigate imbalance penalties associated with Transco  
11 pipeline restrictions, which can be significant. The Company's customers receive  
12 the benefit of each of these aspects of the Company's FT: access to lower cost gas  
13 supply, intraday supply adjustments at minimal cost, and mitigation of punitive  
14 pipeline imbalance penalties.

15 **Q. DOES THIS CONCLUDE YOUR PRE-FILED DIRECT TESTIMONY?**

16 A. Yes, it does.
